CUSTOMER PRESENTATION · VERSION 1.0.0

Item Management System

Items, stock, purchases, billing, barcodes and reports — in one place.

Live v1.0.0 · demo store

One click from the item list creates a scannable Code128 label.

Prepared November 2026 · All screens captured from the deployed application with demo data

AGENDA

Thirteen sections, one business story

Follow the modules in the order a store uses them, or jump to the section you need.

01 **Introduction**
Why stores outgrow paper.

02 **Sign in & dashboard**
The first five minutes.

03 **Store & people**
Branches, users and roles.

04 **Items & masters**
One catalogue for everything.

05 **Barcodes**
Create, print, scan, retrieve.

06 **Purchases**
Buy stock and record it.

07 **Inventory**
Counts, adjustments, transfers.

08 **POS & sales**
Bill customers quickly.

09 **Printing**
Receipts, labels and reports.

10 **Reports & GST**
Numbers you can act on.

11 **Platform admin**
Stores and subscriptions.

12 **End-to-end**
A day in the business.

13 **Benefits & next steps**
What changes for you.

Every screenshot comes from the live v1.0.0 application with a demo store. No customer data is shown.

01

The problem IMS solves

Growing stores rarely fail for lack of effort. They struggle because items, stock, bills and reports live in different places.

1. Item lists and rates drift between notebooks and files
2. Stock is discovered at month-end, not known during the day
3. Owners cannot see branches without calling the manager
4. Billing and reporting do not share the same numbers

INTRODUCTION

Three problems every growing store knows

Different symptoms, one root cause: records that never meet.

BEFORE

Paper and spreadsheets

Item lists, rates and stock counts live in notebooks and files. Two people can hold two different truths, and month-end becomes a reconciliation exercise.

DURING

Disconnected tools

Billing, purchasing, labels and reports each keep their own data. A price change has to be repeated three times, and stock still does not match the shelf.

AFTER

One shared record

IMS keeps the catalogue, stock ledger, bills and reports on the same data. A purchase, sale or adjustment updates stock immediately for everyone who can see that branch.

One catalogue. One stock ledger. One bill. One set of reports — for every branch.

INTRODUCTION

Built for owners, managers and counter staff

The same system answers different questions for each person.

OWNER & MANAGER

See the business, not just the till

- Sales, purchases and stock by branch
- Prices, users and permissions under control
- GST-ready reports without rebuilding spreadsheets
- Branch comparison in one view

COUNTER STAFF

Bill quickly with fewer mistakes

- Scan or search instead of typing codes
- Rate, tax and available stock on screen
- Only the modules their role allows
- A clear cart, total and change amount

Common in grocery, dairy, pharmacy, hardware, apparel, electronics and general retail — one branch or many.

INTRODUCTION

Ten modules. One login.

Everything a store needs to buy, stock, sell and report — without switching tools.

01
Items & masters
Codes, categories, units, tax and rates.

02
Purchases
Supplier bills that update stock.

03
Inventory
On hand, adjustments, movements.

04
Transfers
Move stock between branches.

05
POS billing
Scan, discount, tax, payment.

06
Sales records
Invoices, cancellations, history.

07
Barcode labels
Code128 labels, 1–100 copies.

08
Printing
Thermal receipts and print history.

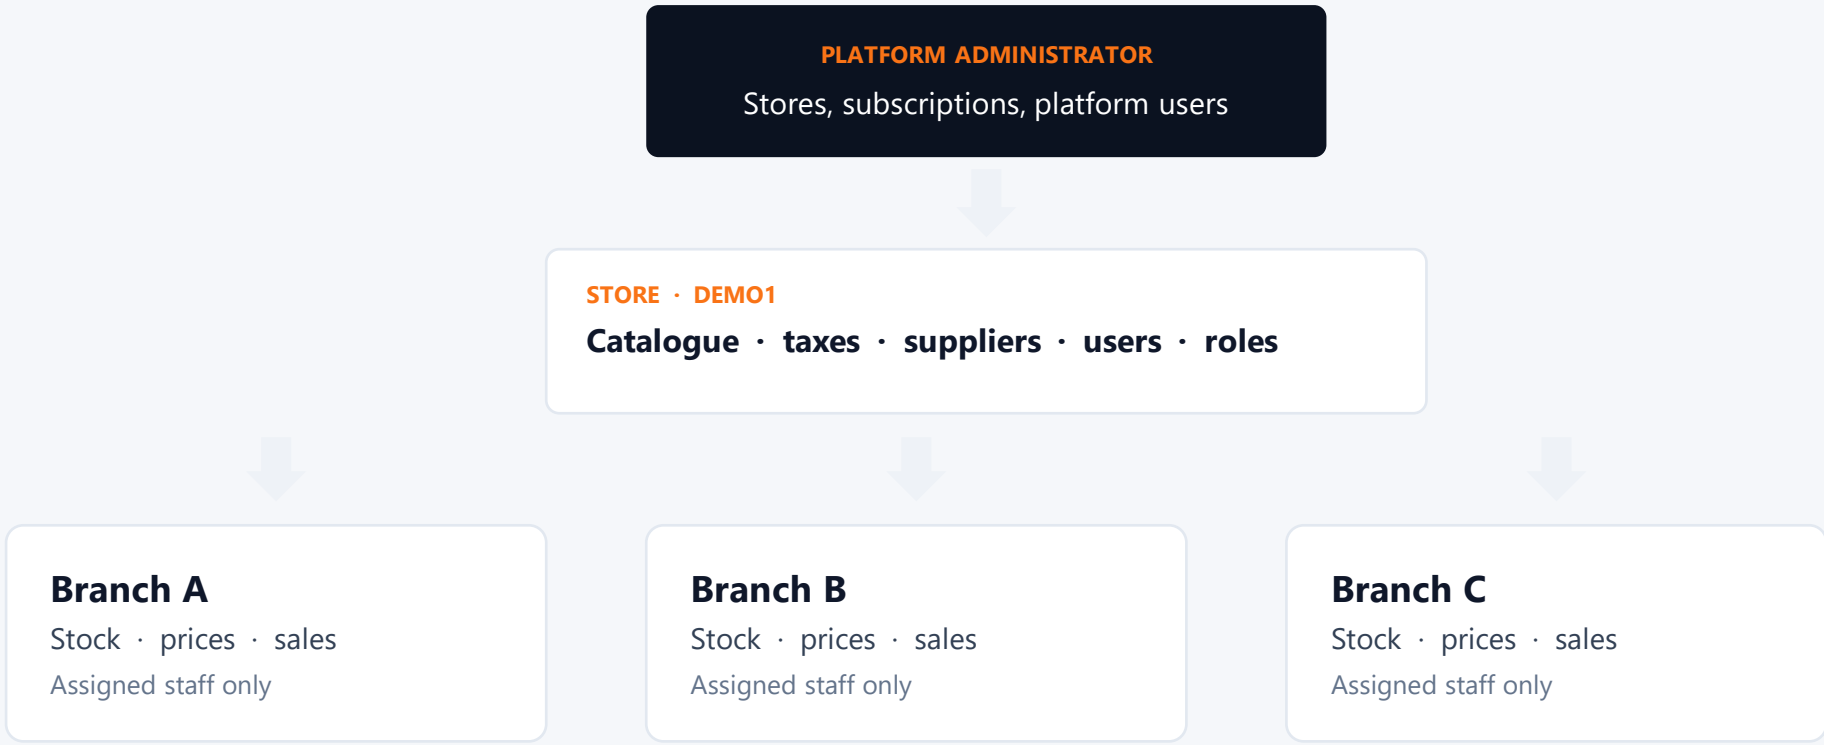

09
Reports & GST
Sales, purchases, profit, stock, GST.

10
Access & platform
Roles, branches, subscriptions.

INTRODUCTION

One store today. A network tomorrow.

Masters stay shared; stock and selling prices stay branch-specific.

SHARED MASTERS

One item list, tax set and supplier list for the store.

LOCAL STOCK

On-hand quantity and selling price belong to each branch.

SCOPED ACCESS

A branch user only sees the branches assigned to them.

PLAN LIMIT

The subscription sets how many branches the store can run.

02

Sign in, dashboard, access

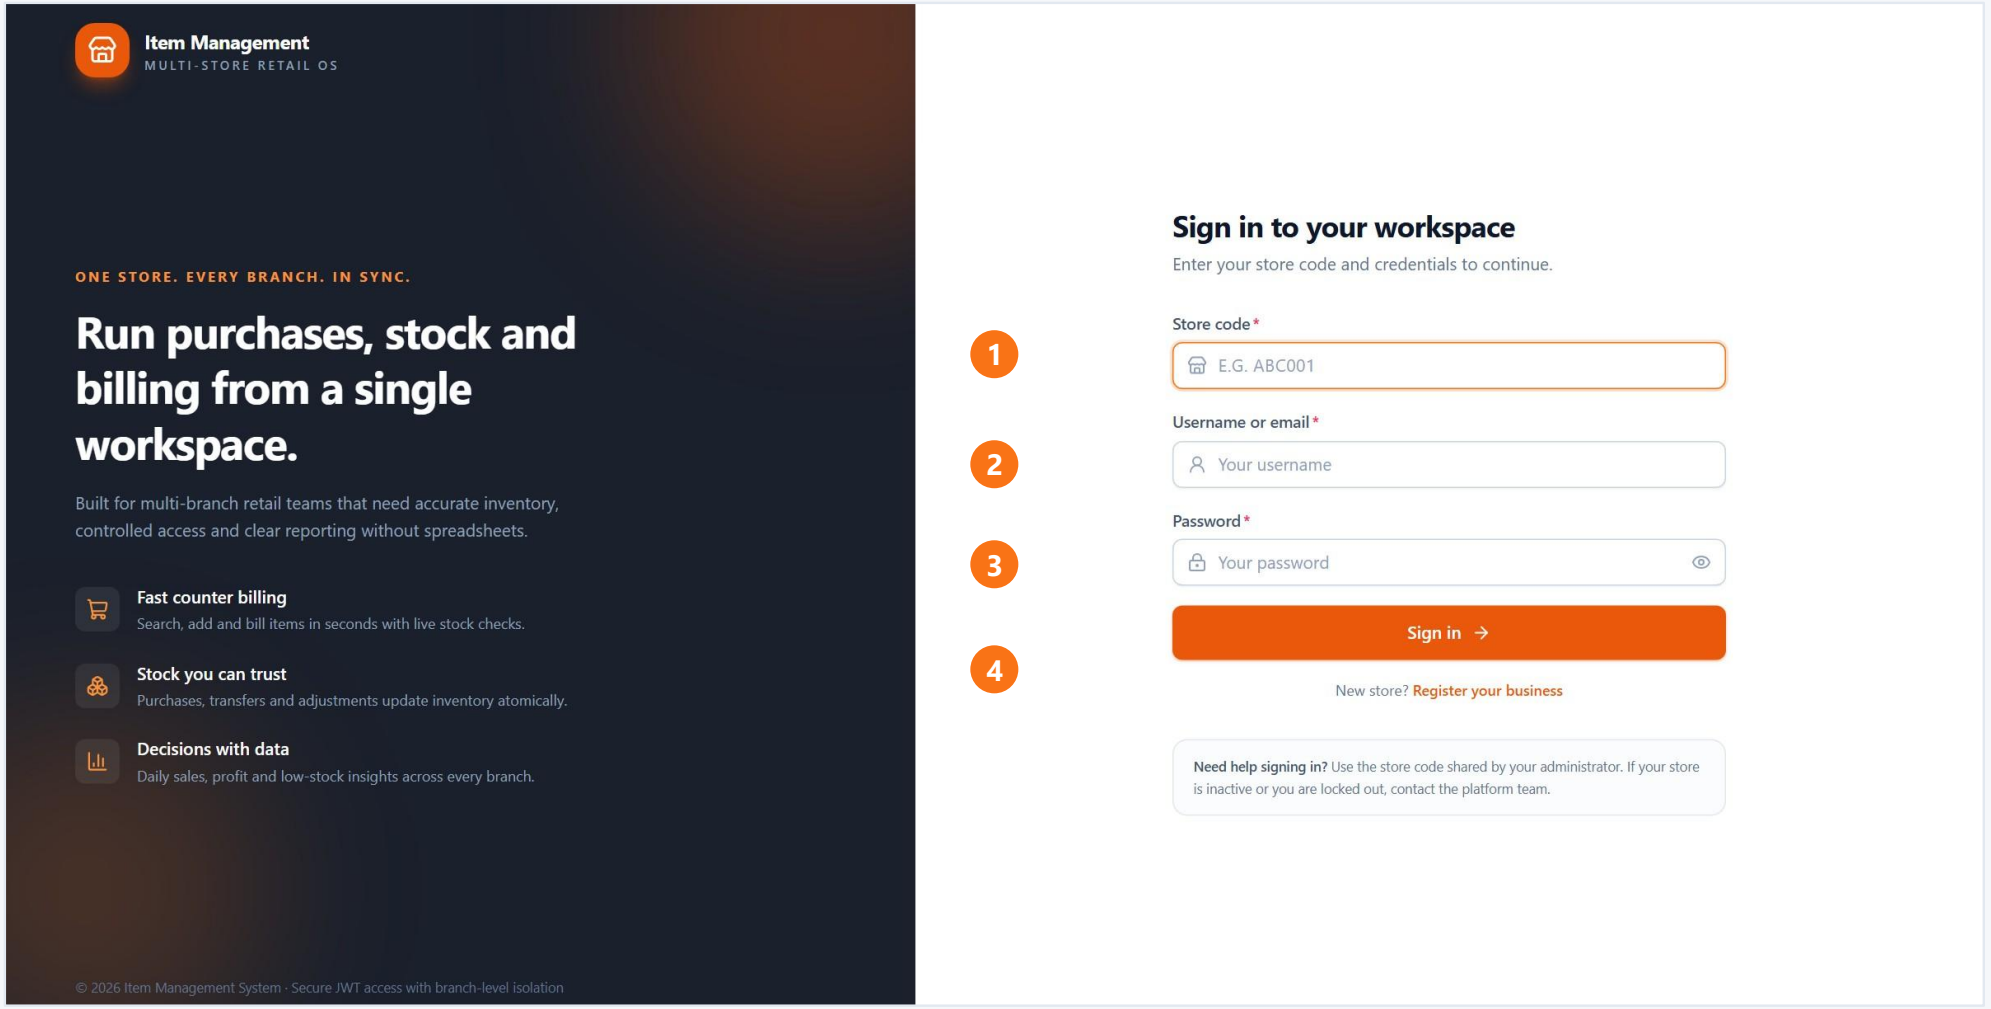

The first five minutes: how a person signs in, what they see, and why two people see different things.

1. Store code, username and password
2. The dashboard and its four headline numbers
3. Branch selection in the header
4. Platform, owner and employee access

ACCESS

Sign in with a store code, not a shared login

Every person has their own username, password and role — and the session expires after 12 hours.

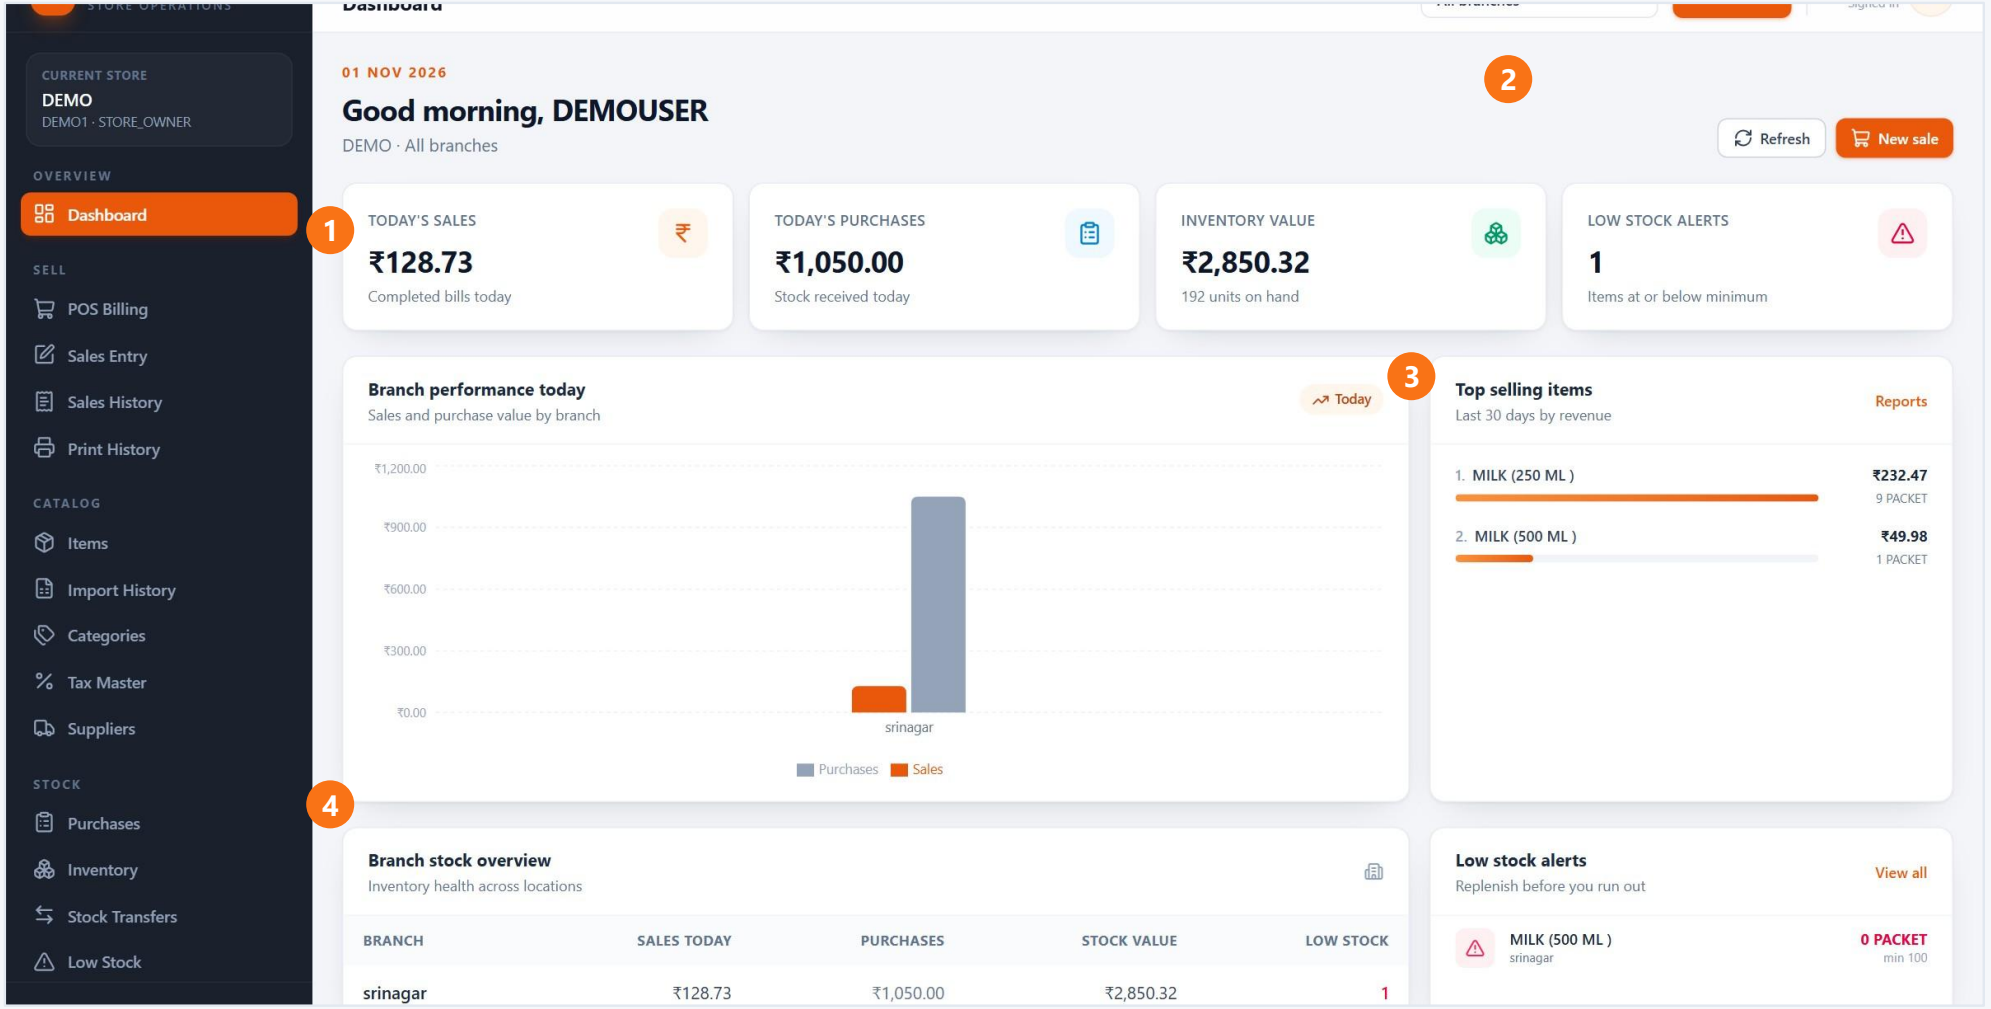

1 **Store code** 2 **Username** 3 **Password** 4 **Sign in**

ACCESS

The dashboard answers four questions before coffee

Today's sales, today's purchases, stock value and low-stock alerts — for all branches or the one you choose.

1 **Today's KPIs** 2 **Branch filter** 3 **Top sellers** 4 **Branch stock**

ACCESS

Three levels of access, clearly separated

The platform runs the service; the owner runs the store; employees run the counter.

PLATFORM ADMIN

Runs the platform

Creates stores, manages subscriptions and store login accounts, resets credentials and reads the platform audit trail. Does not open a store's sales, stock or items.

STORE OWNER

Runs the store

Full control of the catalogue, purchases, sales, inventory, reports, users and roles. Sees every branch unless a role narrows it. Can create custom roles from 30 permissions.

EMPLOYEE

Runs the counter

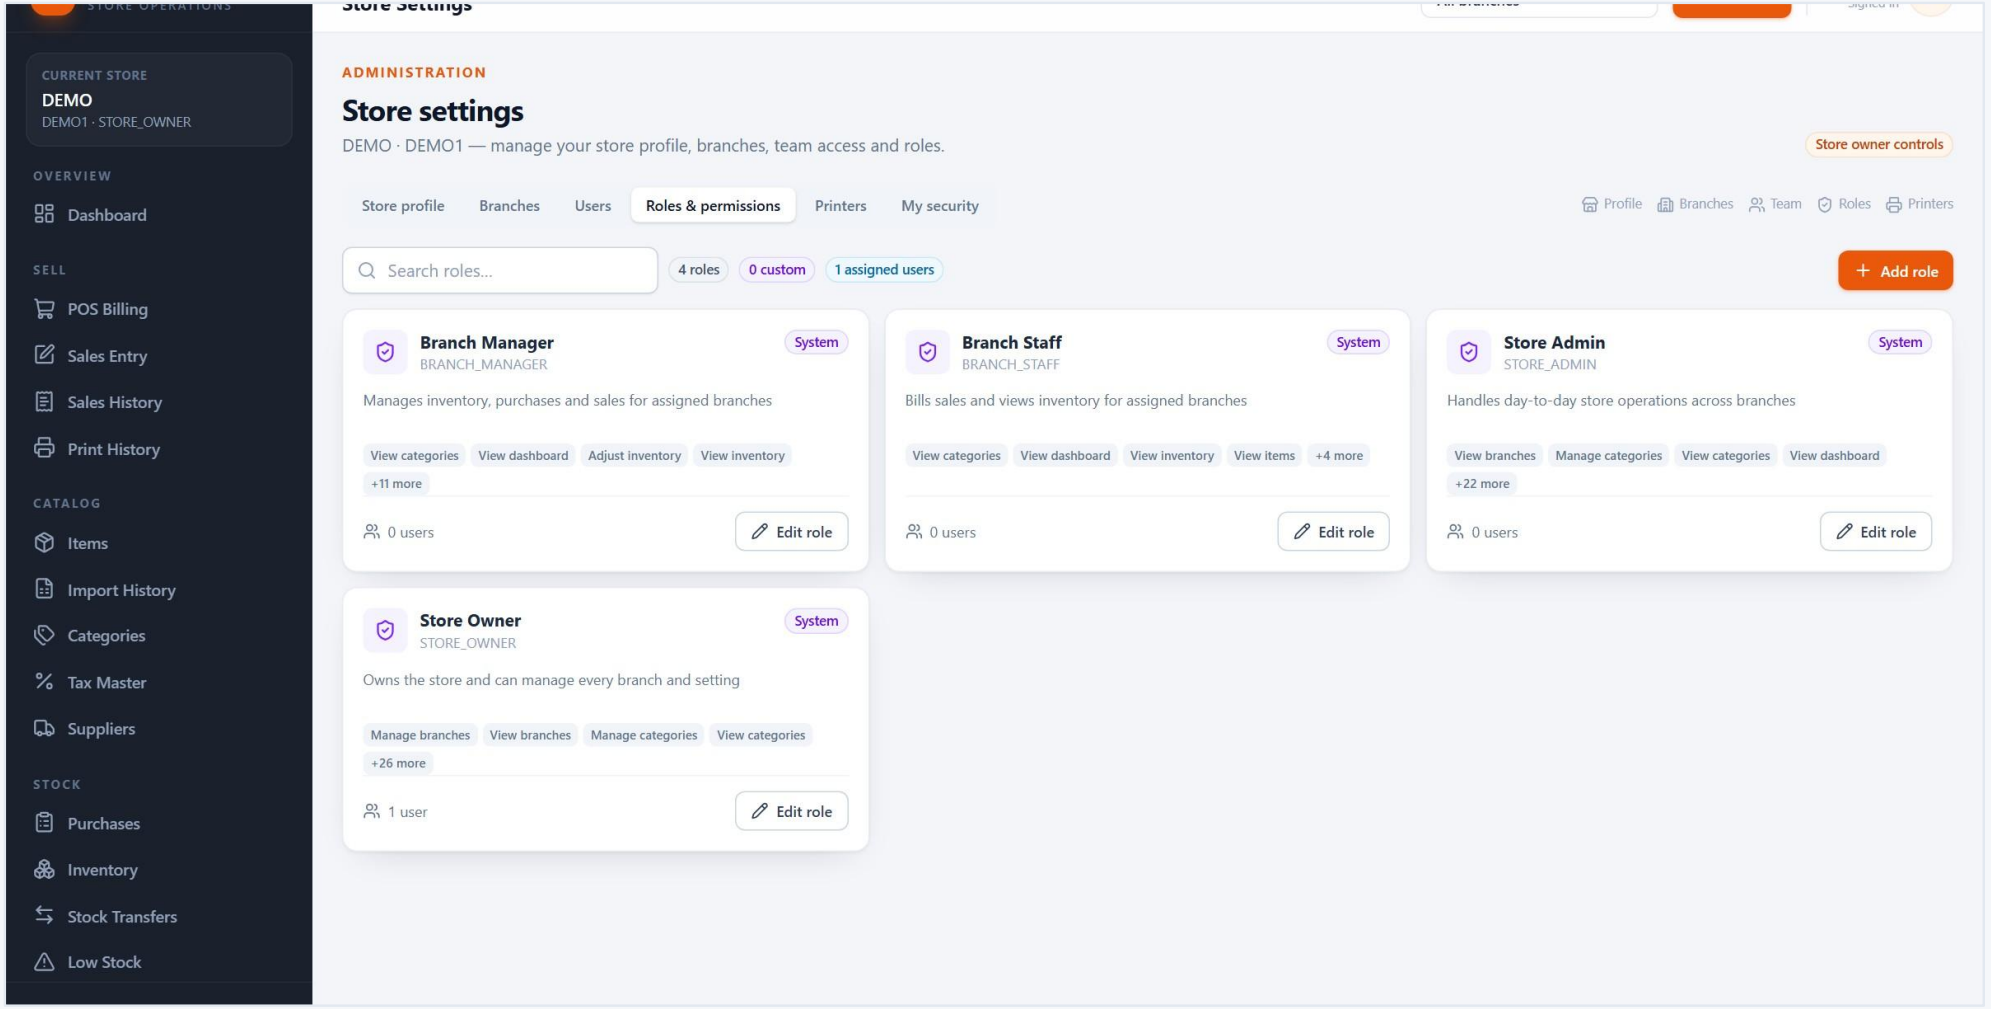

Branch Manager or Branch Staff. Sees assigned branches only, and only the modules and actions allowed by their role — for example billing and stock checks, without settings.

Sessions last 12 hours; five failed attempts lock the account for 15 minutes; first sign-in forces a password change.

ACCESS

Roles are visible, editable and permission-based

Four system roles ship with IMS; the owner can add custom roles using the same permission set.

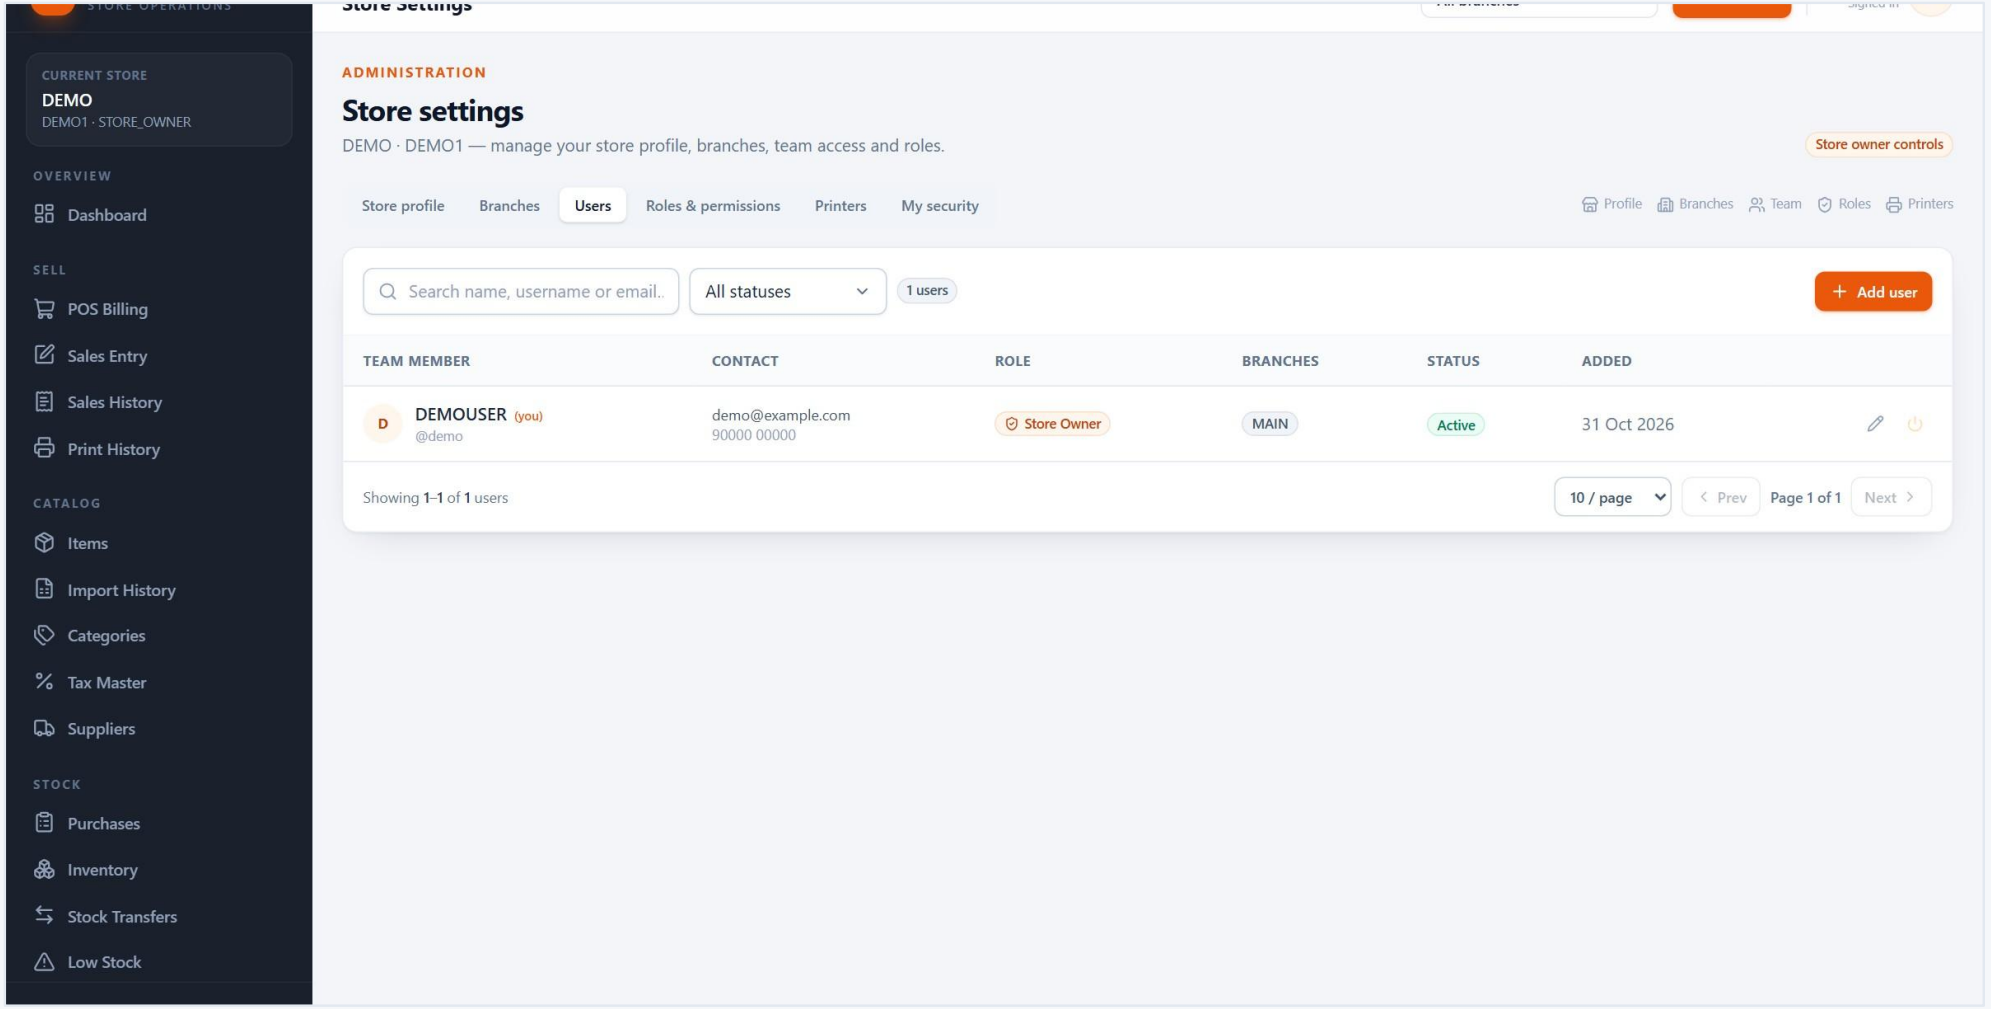

- **System roles and their permission counts**
- **Permissions granted by each role**
- **Add role, top right**

ACCESS

One team list, with role and branch access

Adding a user sets their login, their role and the branches they may work in.

- **Team members and their role**
- **Branch access per person**
- **Add user from the top right**

03

Store, branches and people

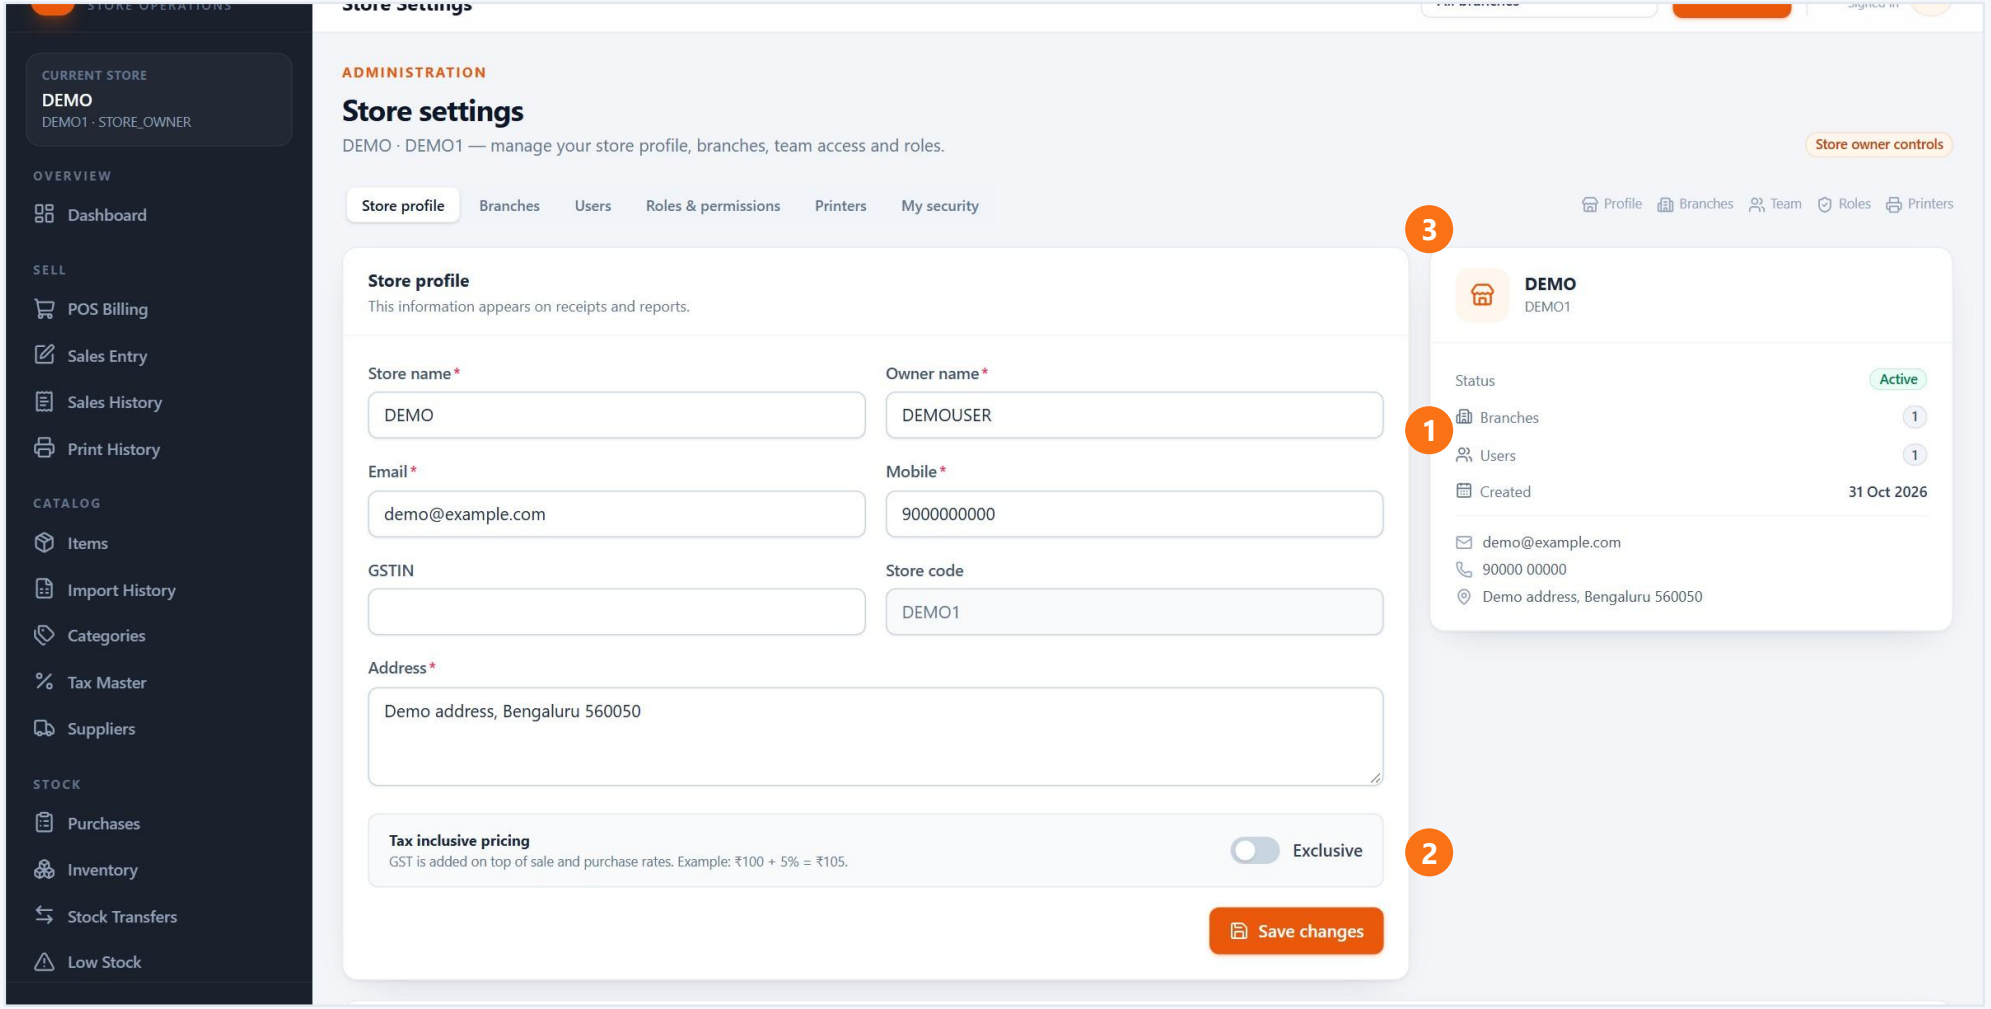

Before the first item is created, the store needs its identity, its locations and its team.

1. Store profile, GSTIN and tax mode
2. Branches and the subscription limit
3. Adding a user with the right role
4. How data is kept inside the store

STORE SETUP

The store profile feeds receipts and reports

Name, owner, contact, address, GSTIN and the tax mode apply across the whole store.

1 **Store identity**

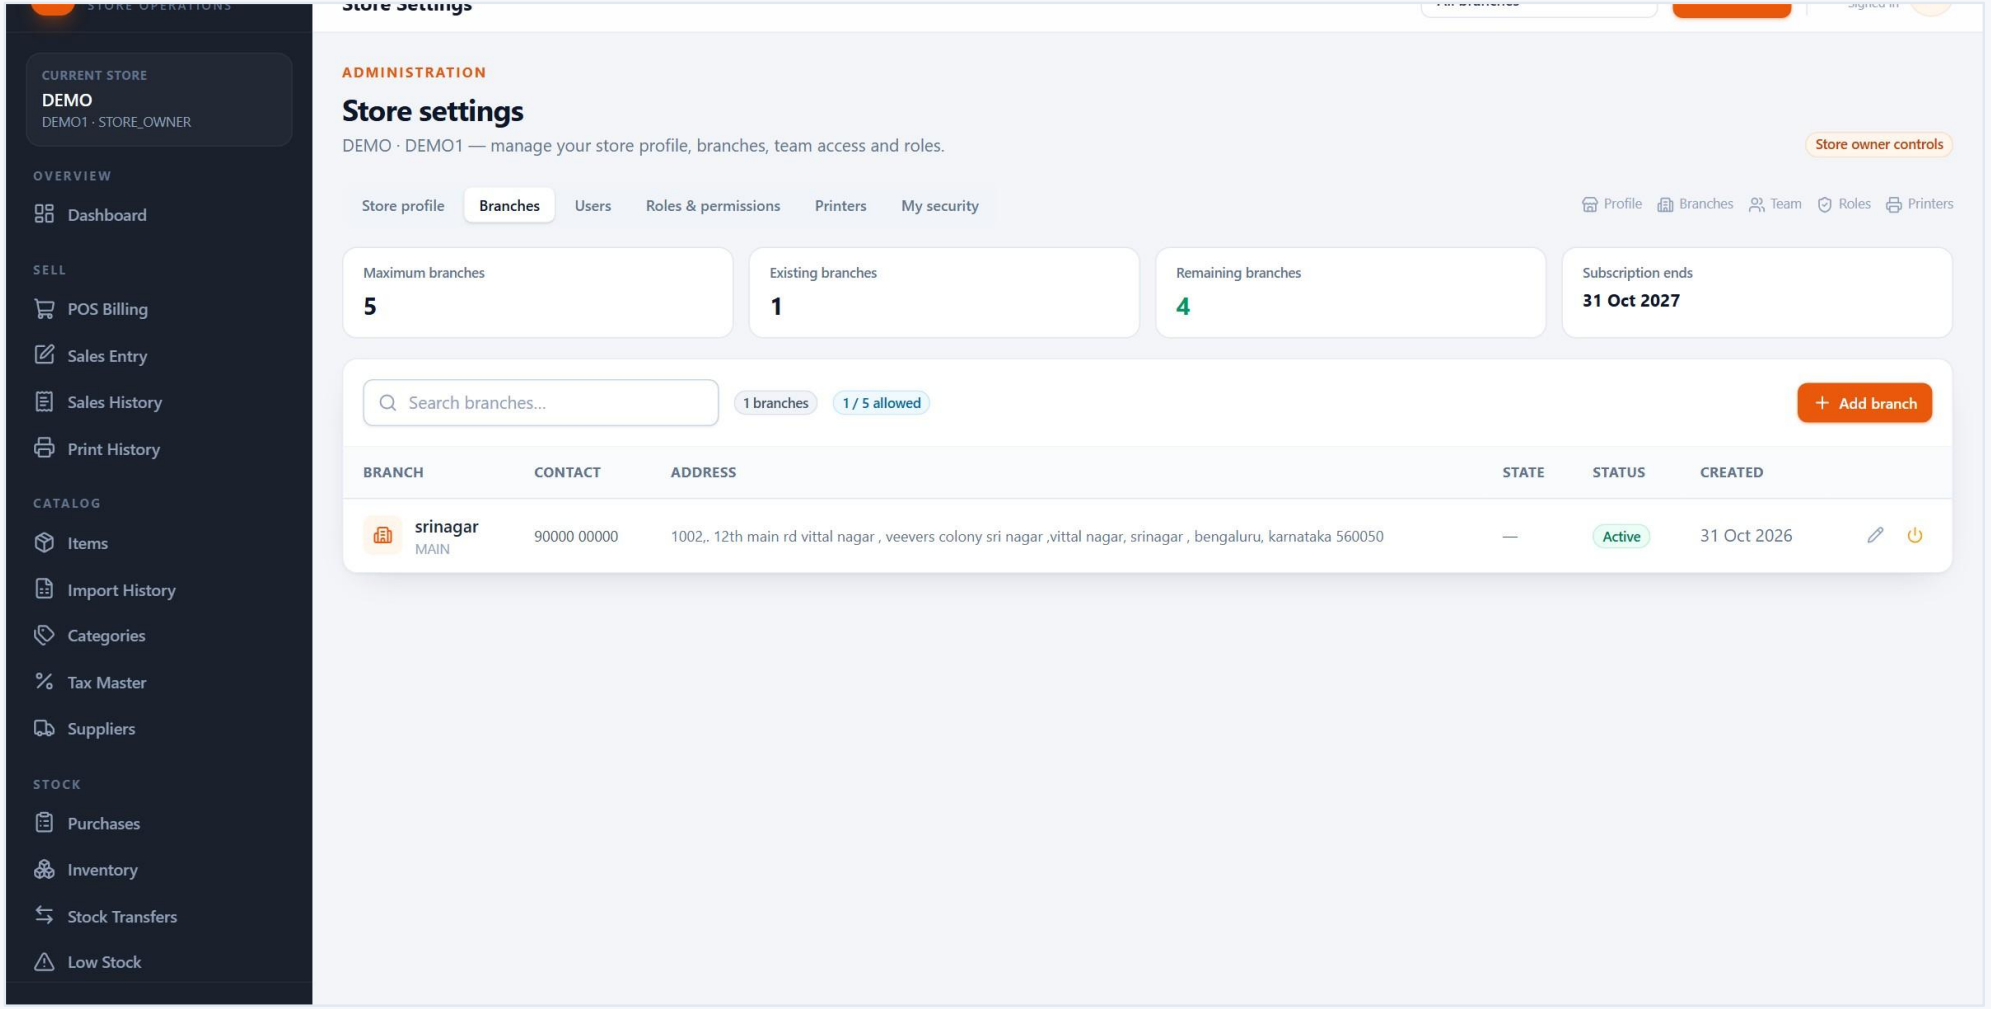

2 **Tax mode**

3 **Subscription**

STORE SETUP

Branches are locations, not separate systems

The demo store runs one branch out of a five-branch allowance; each branch keeps its own stock and prices.

- **Branches and their addresses**
- **1 of 5 branches used**
- **Add branch, top right**

STORE SETUP

Adding a user takes four decisions

Identity, role, branch access, then a password the person must change.

1. **Login identity**

   Full name, username and email for the person — not a shared counter login.

2. **Role**

   Choose a system role or a custom one; the role decides modules and actions.

3. **Branch access**

   Tick the branches this person may work in. Empty means the role decides.

4. **First password**

   The user signs in and is forced to set a new password before working.

STORE SETUP

Your data stays inside your store

Separation is built into the data model, not added as a setting.

01

Store isolation

Every item, sale, purchase and setting belongs to one store. Queries are filtered by the signed-in store before any record is returned.

02

Branch scoping

Stock, prices and sales are held per branch. A user sees only the branches assigned to them, and the branch selector cannot widen that list.

03

Server-side checks

Permissions are checked on every request, not only by hiding buttons. A copied link or a direct API call still hits the same check.

04

Accountability

Credential changes are recorded in the platform audit trail, with filters and CSV export. Sign-in sessions expire after 12 hours.

Store owners control their own users and roles. Platform staff never open store business records.

04

Items and master data

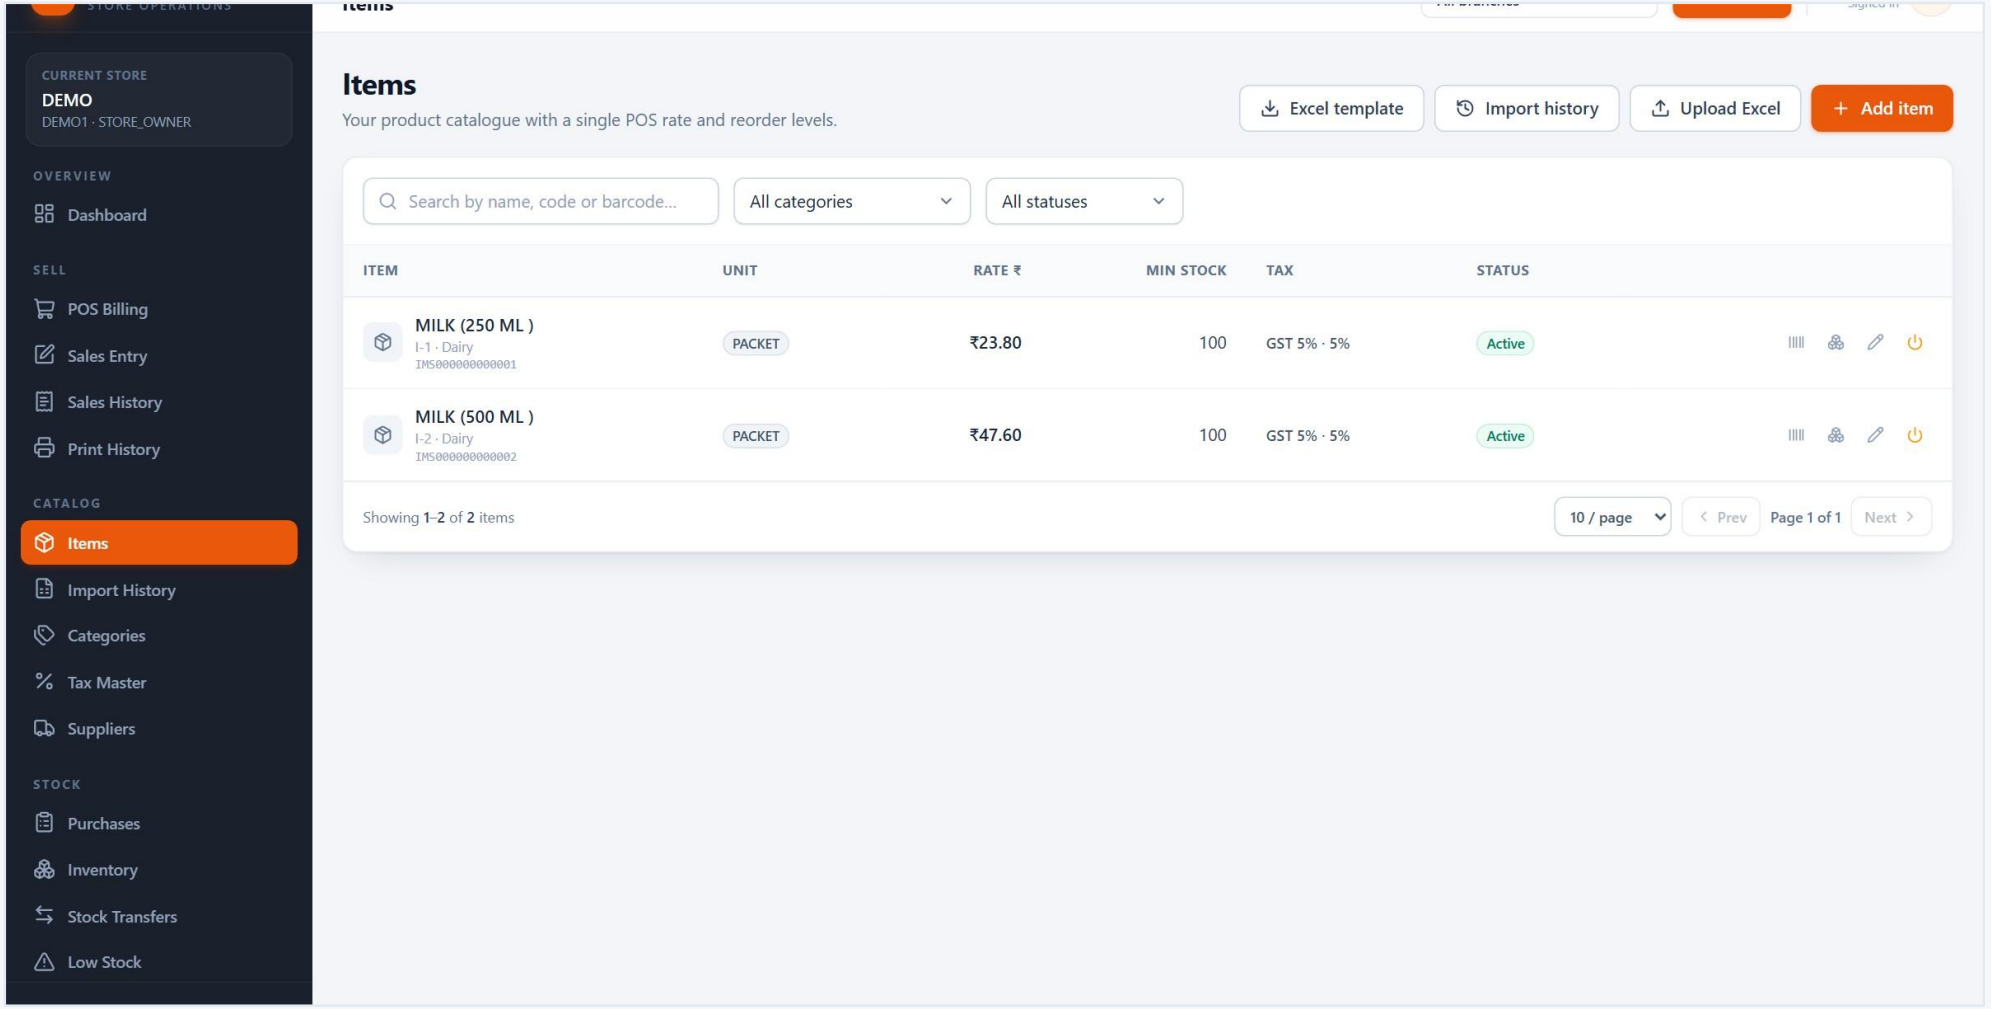

The catalogue is the foundation: every purchase line, bill, barcode and report points back to an item.

1. Items, codes, units, rates and tax
2. Categories and GST slabs
3. Suppliers and item editing
4. Excel import with preview and history

ITEMS

One catalogue, with the details that drive billing

Code, name, unit, master rate, minimum stock, tax and barcode — on one row.

- **Code & barcode**
- **Master rate**
- **Tax**
- **Item actions**

ITEMS

Creating an item is a single short form

Most fields are optional; the name, unit, rate and tax decide how it behaves.

1 Name and code

A human-readable item code; the name is what staff search for.

2 Category and unit

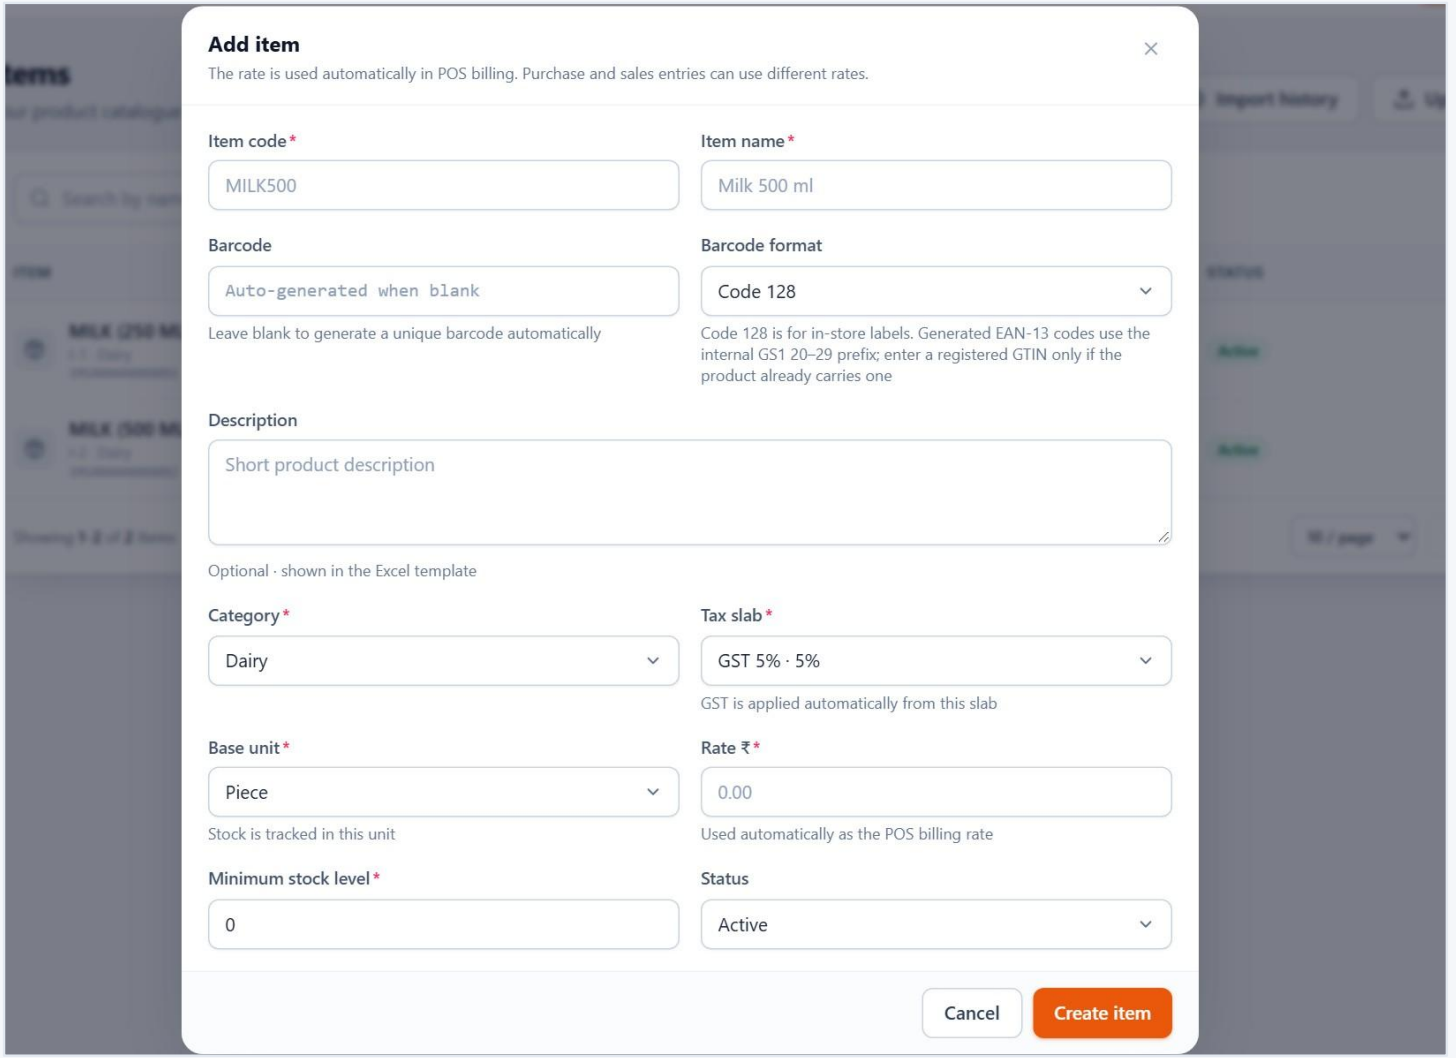

Category groups items in reports; unit drives quantity labels.

3 Rate and tax

The master rate is the POS price; tax comes from the tax master.

4 Description

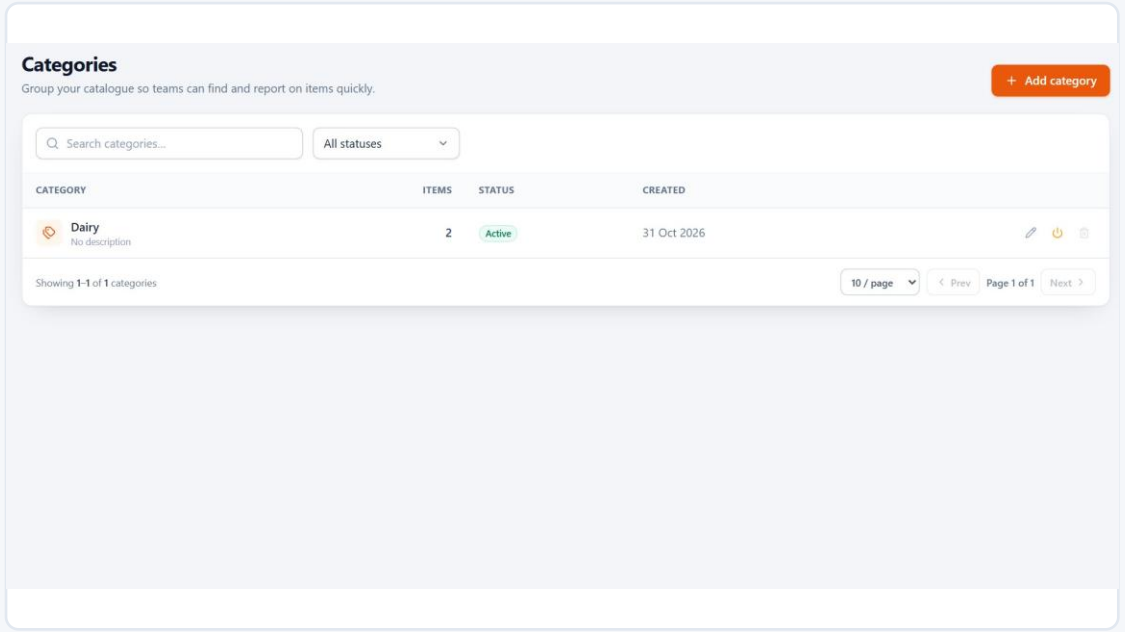

Optional notes such as pack size, brand or shelf location.

ITEMS

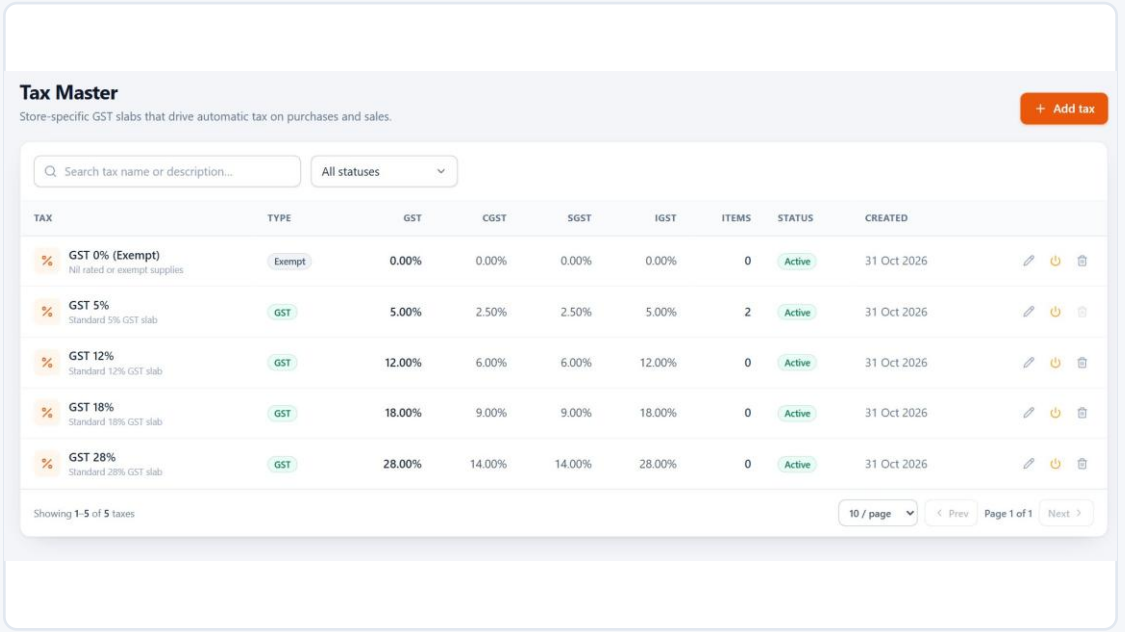

Categories and tax slabs keep the catalogue consistent

Two small masters remove most of the free text — and most of the reporting errors.

Categories

Group items once; every item, purchase and report can then be filtered by category. Deleting is blocked while items still use it.

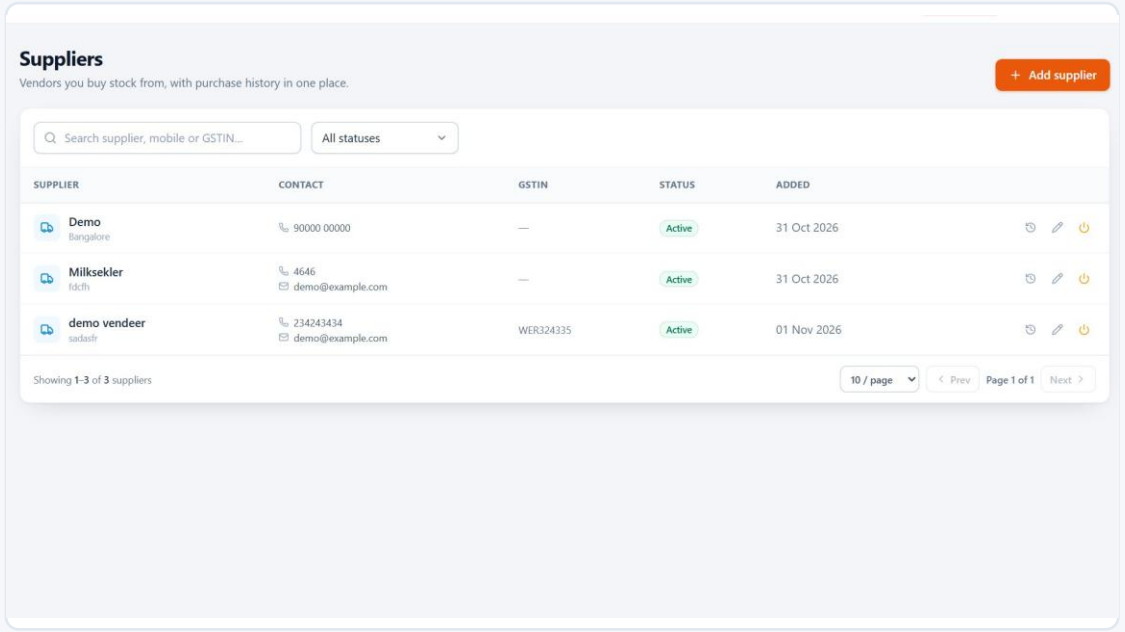

Tax master

GST slabs of 0, 5, 12, 18 and 28 percent. Each slab carries CGST, SGST and IGST rates, so item setup only needs a name.

ITEMS

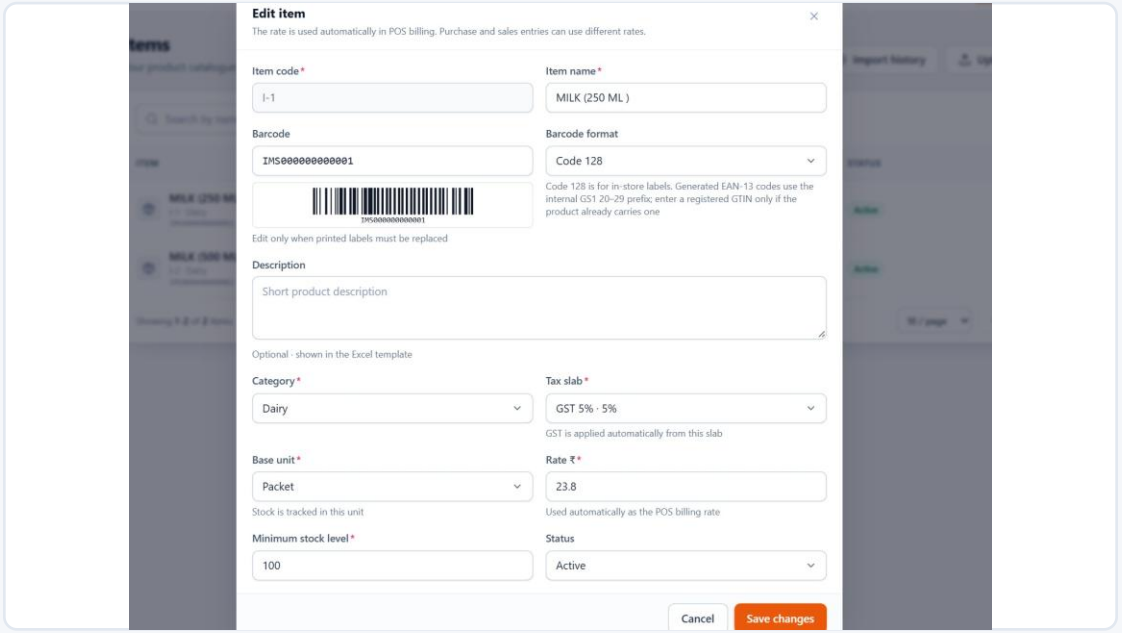

Suppliers and edits — without breaking history

Supplier records feed purchase entry; editing an item updates the master, not past bills.

Suppliers

Name, contact and GST details for the businesses you buy from. They appear automatically in the purchase form.

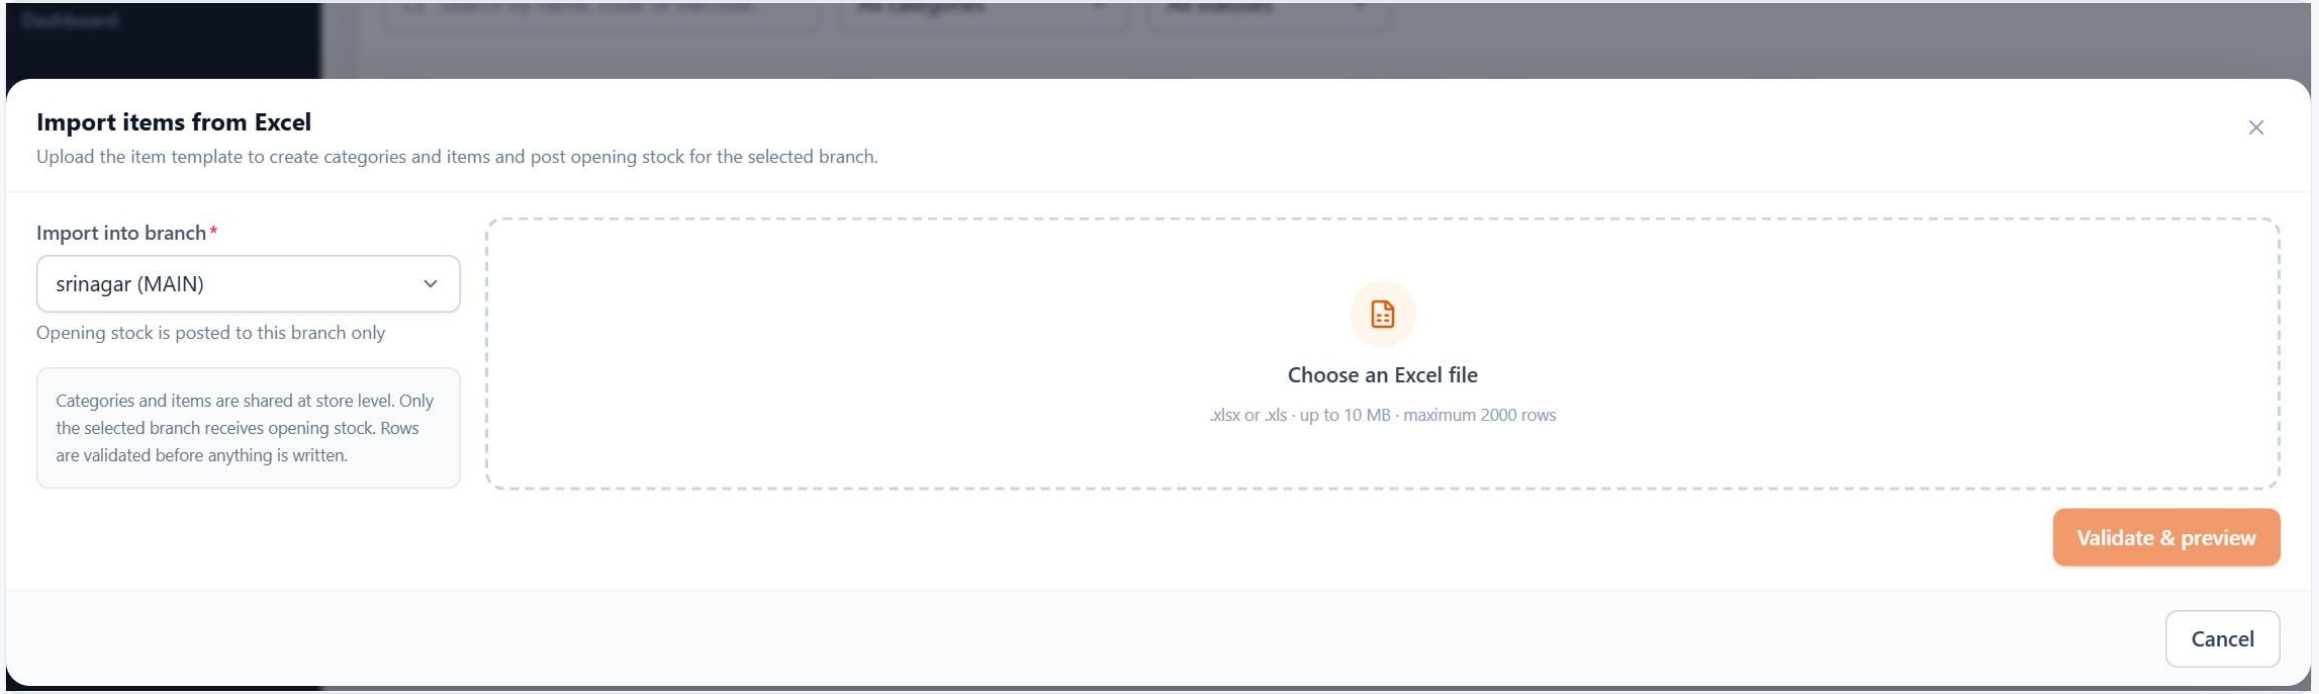

Item editing

Change name, category, unit, rate or tax. Completed bills keep the rate and tax they were saved with.

ITEMS

Import an existing catalogue from Excel

Download the template, upload, preview every row, then confirm — nothing is written until you say so.

1 Start from the template
Columns for code, name, category, unit, rate, tax and opening stock.

2 Preview first
IMS validates the file and shows what will be created before anything is saved.

3 Choose the branch
Opening stock is posted to the branch selected in the dialog, not to all branches.

4 Keep a history
Each import is listed with its row counts, so a failed file can be traced.

Excel .xlsx or .xls · up to 2,000 rows per import · the same file cannot be imported twice.

ITEMS

Practical example: add a one-litre milk pack

Five decisions, about thirty seconds, and the item is ready for purchase, stock and POS.

1 Category

Create or choose Dairy so the item appears in the dairy filter.

2 Unit

Pick LITER — the unit appears on the bill and in stock reports.

3 Tax

Choose the 5 percent GST slab used for this product.

4 Rate

Enter the master selling rate used by POS; branch prices can differ later.

5 Save & label

Save the item, then open Barcode label to print the first sticker.

Tip: the item code is for people, the barcode is for the scanner. You can keep an existing code such as MILK-1L and still print a scannable IMS barcode for it.

Result: the item is searchable, purchasable, stocked at the selected branch and ready for a barcode label.

05

Barcode management

The feature that changes the counter: create once, print once, scan every time after that.

1. Create the item, then generate its barcode
2. Print 50 × 30 mm labels, 1 to 100 copies
3. Scan with a USB or Bluetooth scanner
4. Retrieve the item instantly, with no typing

BARCODES

The barcode journey, end to end

Six steps from a new product to a scanned item — the barcode is stored with the item at step three.

1 Create item

Name, unit, rate and tax. No barcode needs to exist yet.

2 Generate barcode

Open the label action; IMS assigns a Code128 code automatically.

3 Save item

The barcode is stored on the item and stays unique inside the store.

4 Print label

50 × 30 mm PNG; choose 1 to 100 copies and print from the browser.

5 Scan barcode

USB or Bluetooth scanner types the code into the scan field.

6 Retrieve item

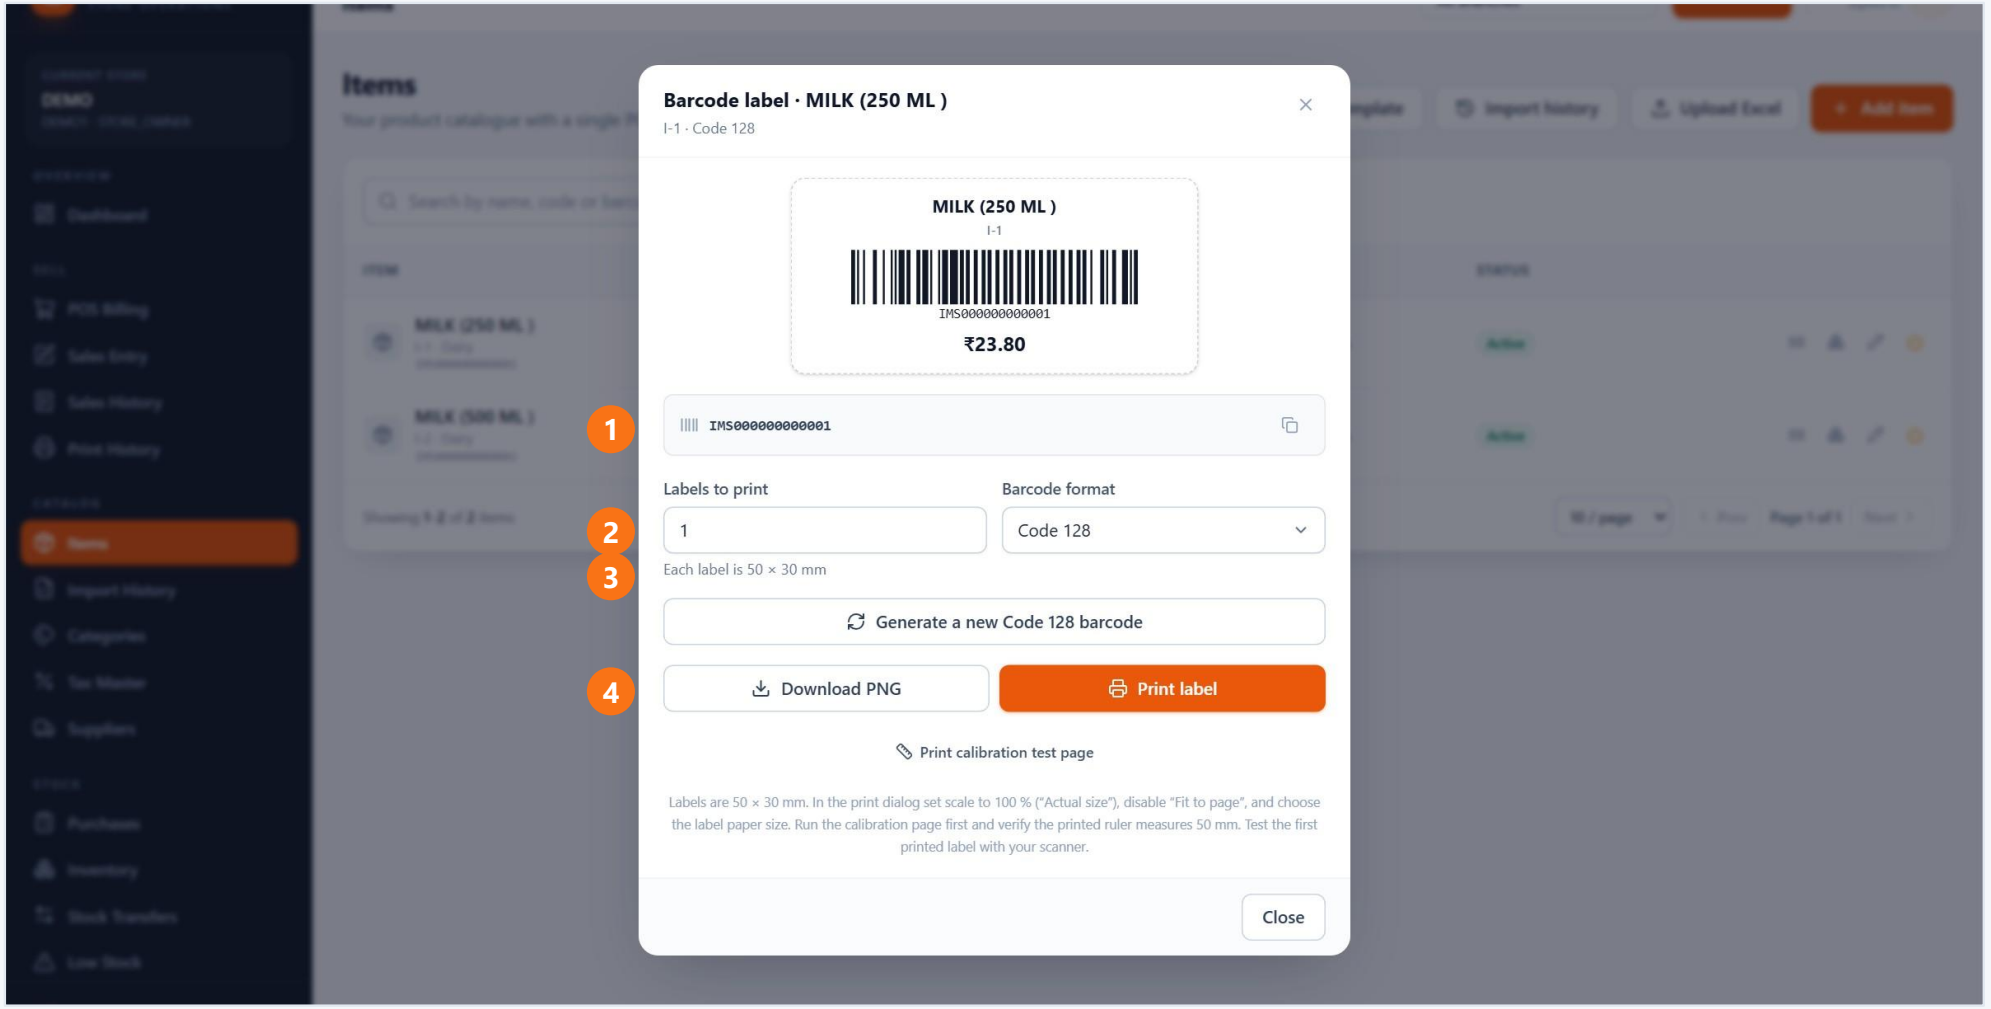

The item, rate, tax and branch stock appear in the bill.

The barcode is saved with the item, so a lost sticker is a reprint — not a new product record.

BARCODES

The label screen is the whole label workflow

Preview, size, copies, download and print — one dialog, no design software.

1 **Barcode value**

2 **Copies 1–100**

3 **50 × 30 mm**

4 **Download / print**

BARCODES

What is actually stored, and what the scanner sees

Four details that explain why barcode setup stays simple.

01

Generated for you

Opening the label assigns a Code128 barcode in the form IMS + ten digits, for example IMS000000000001. No barcode designer is involved.

02

Unique per store

The store cannot hold two items with the same barcode. The item code remains separate and human-readable, so both can be used in search.

03

Internal vs retail

EAN-13 codes with the prefix 20 are reserved for internal labels. A GS1 badge appears only for a genuine external retail GTIN.

04

Stored and reprintable

The barcode is saved on the item, shown in lists, and can be printed again at any time — including after a sticker is damaged.

Labels are 50 × 30 mm PNG files; print 1–100 copies from the browser — no label software required.

BARCODES

Scanning needs hardware, not installation

A USB or Bluetooth scanner behaves like a keyboard. The camera option needs nothing but the browser.

SUPPORTED HARDWARE

- USB barcode scanner in keyboard-wedge mode — the most common counter scanner.
- Bluetooth scanner paired as a keyboard (HID); no proprietary driver or SDK.
- Any scanner that types the code and sends Enter; most ship configured this way.
- Phone or webcam as a fallback: the browser camera scans Code128 directly.

WHERE SCANNING WORKS

- POS billing: scan into the search box and the item joins the cart.
- Manual sales entry: the scan field adds an item line with its tax.
- Item list and search fields accept a code or barcode as text.
- The item is matched inside the signed-in store, then stock is read from the selected branch.

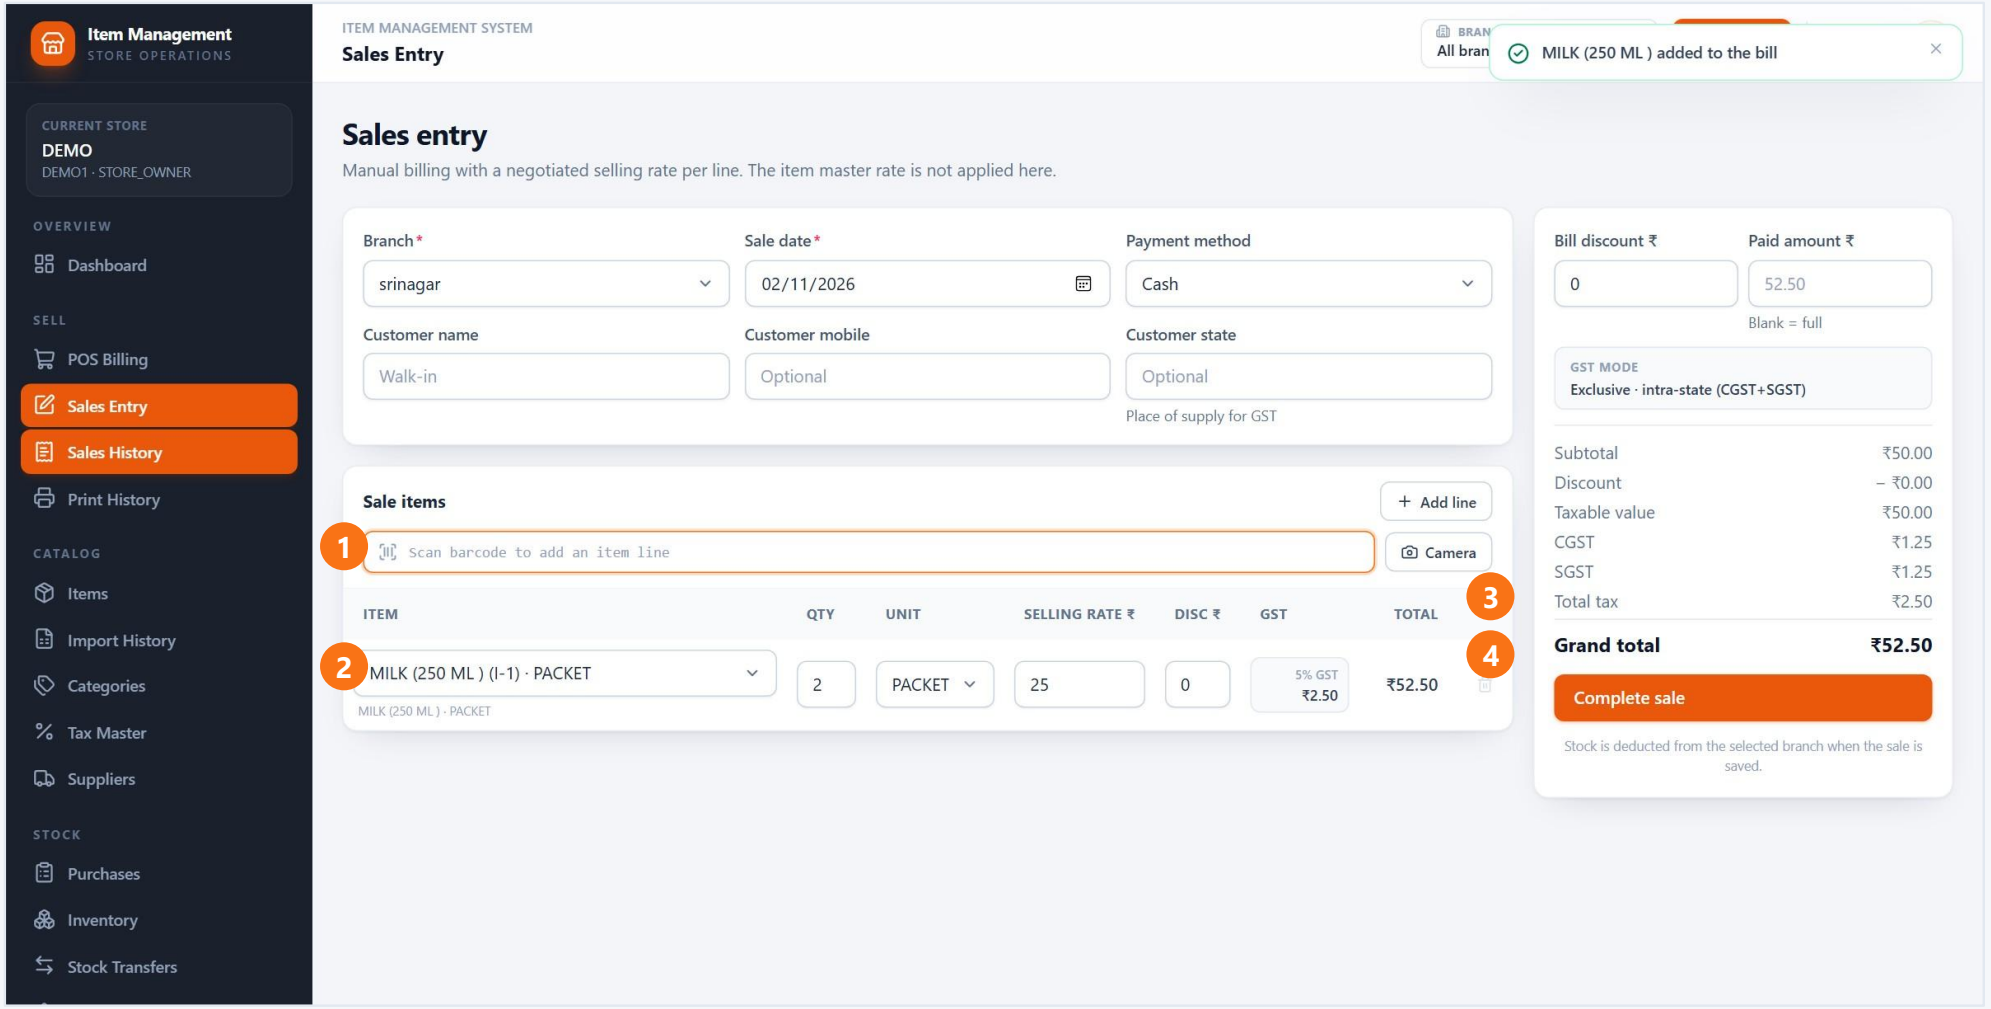

SETUP IN THREE STEPS

Plug in or pair the scanner → click the scan field so the cursor is there → scan a label. If nothing appears, the scanner is usually missing the Enter suffix — enable it in the scanner's configuration barcode.

BARCODES

Scan once, and the bill builds itself

The scan filled the item line, applied the 5% tax and calculated the total — no code was typed.

1 **Scan field** 2 **Item found** 3 **Tax applied** 4 **Total**

06

Purchase management

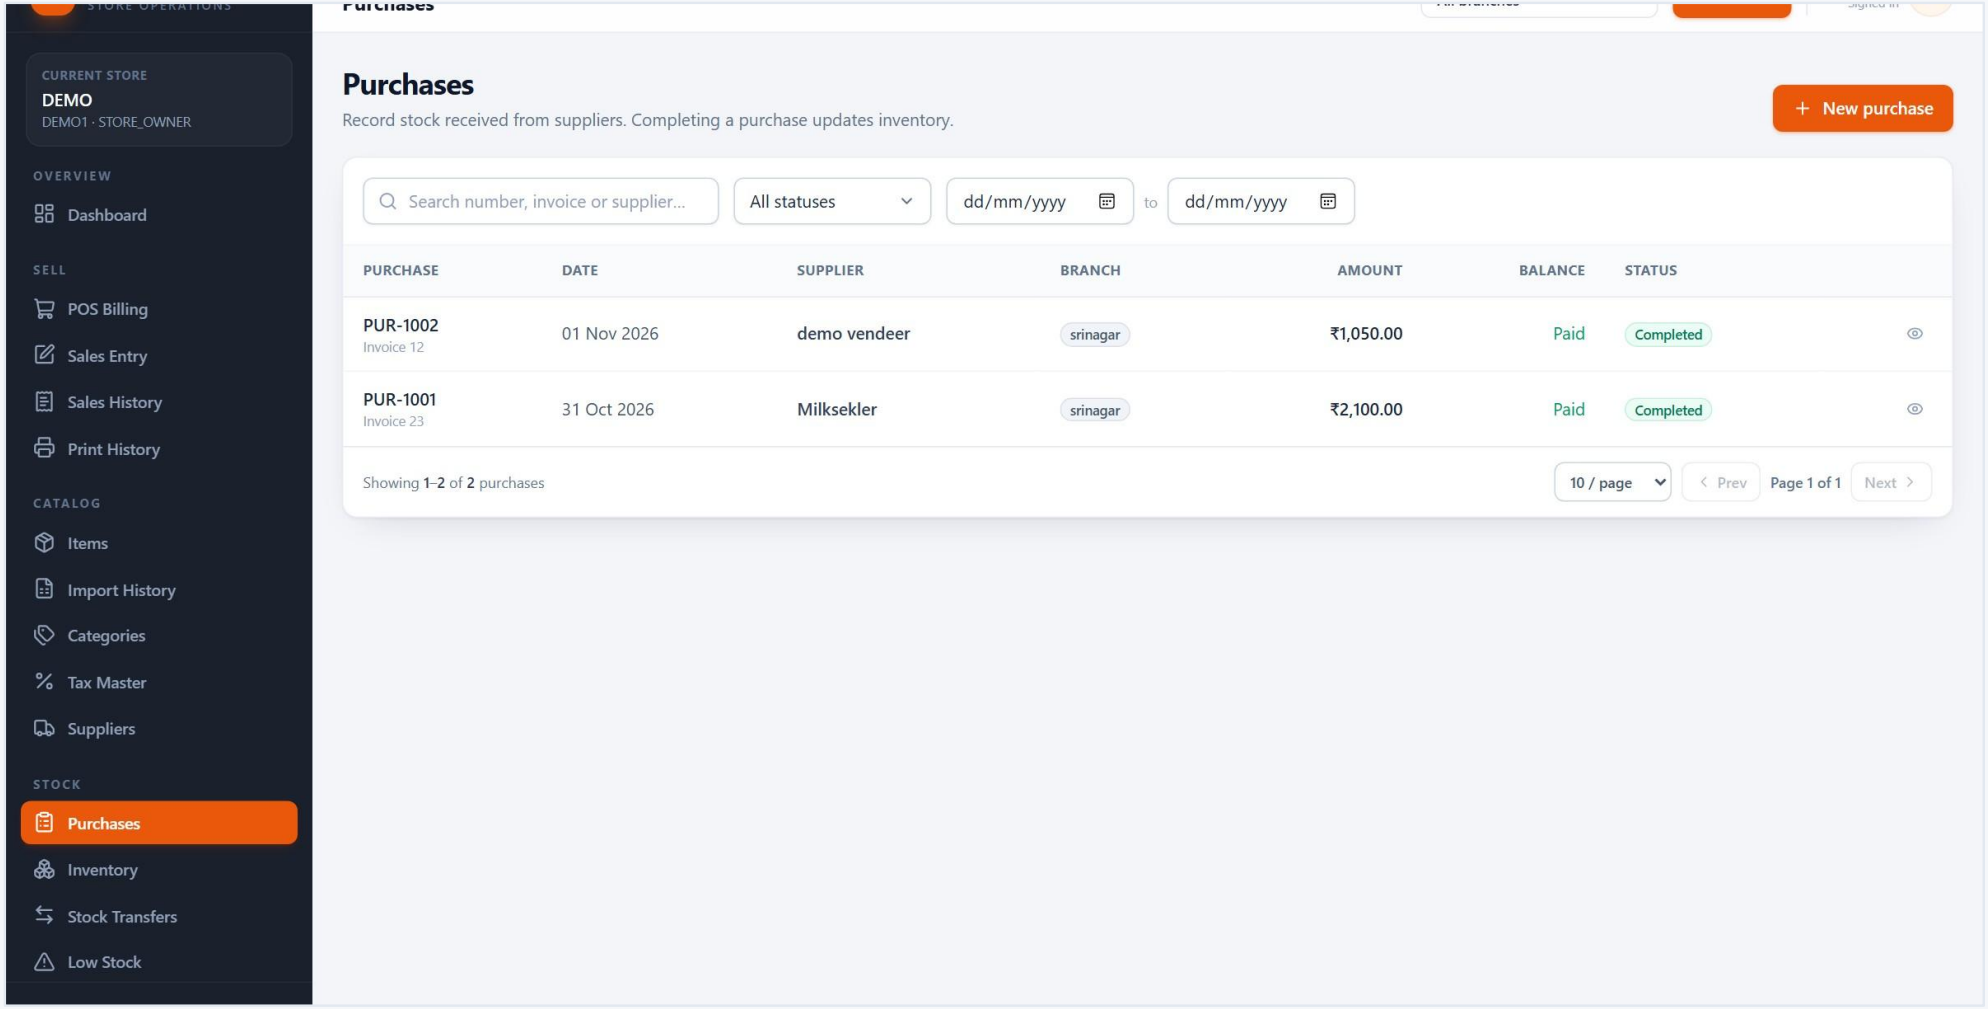

Stock arrives before it can be sold. Purchases are how the system learns what came in, at what cost, from whom.

1. Purchase list with draft, completed, cancelled
2. Supplier, items, quantity, rate and tax
3. What completion does to stock and cost
4. Cancelling a mistake without losing the record

PURCHASES

Every supplier bill in one list

Purchase number, supplier, date, status and total — with a drill-down on every row.

- **Purchase records**
- **Supplier**
- **Status**
- **Total**

Raising a purchase is a line-by-line form

Choose the branch and supplier, add items, then save as draft or complete the bill.

1 Branch and supplier

The branch receives the stock; the supplier comes from the supplier master.

2 Item lines

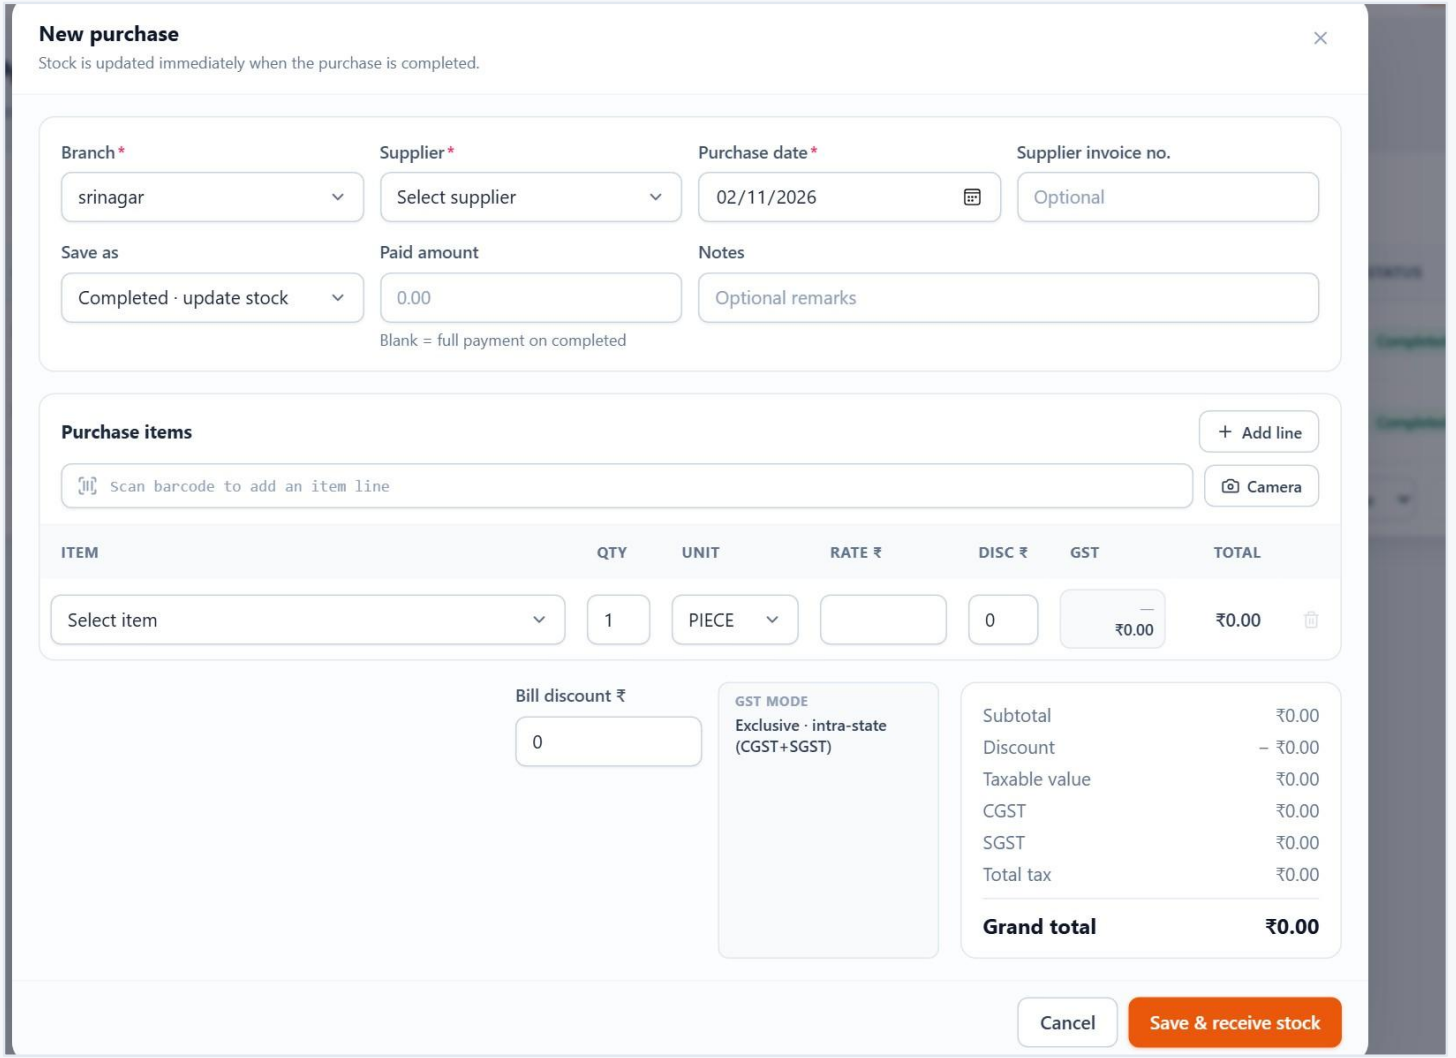

Add each item with quantity, purchase rate and the tax that applies.

3 Totals

IMS calculates line tax, taxable value and the bill total as you type.

4 Draft or complete

A draft can wait; completing posts stock and average cost immediately.

Completing a purchase changes stock and cost

The record keeps the supplier, lines, tax and total — and reverses cleanly if cancelled.

1. **Stock in**

   Each line increases the quantity on hand at the selected branch.

2. **Average cost**

   The branch's weighted average purchase cost is recalculated for margin reports.

3. **Tax snapshot**

   The rate and tax on the line are stored with the bill, not re-read later.

4. **Cancel reverses**

   Cancelling a completed purchase removes its stock effect and keeps the record.

07

Inventory management

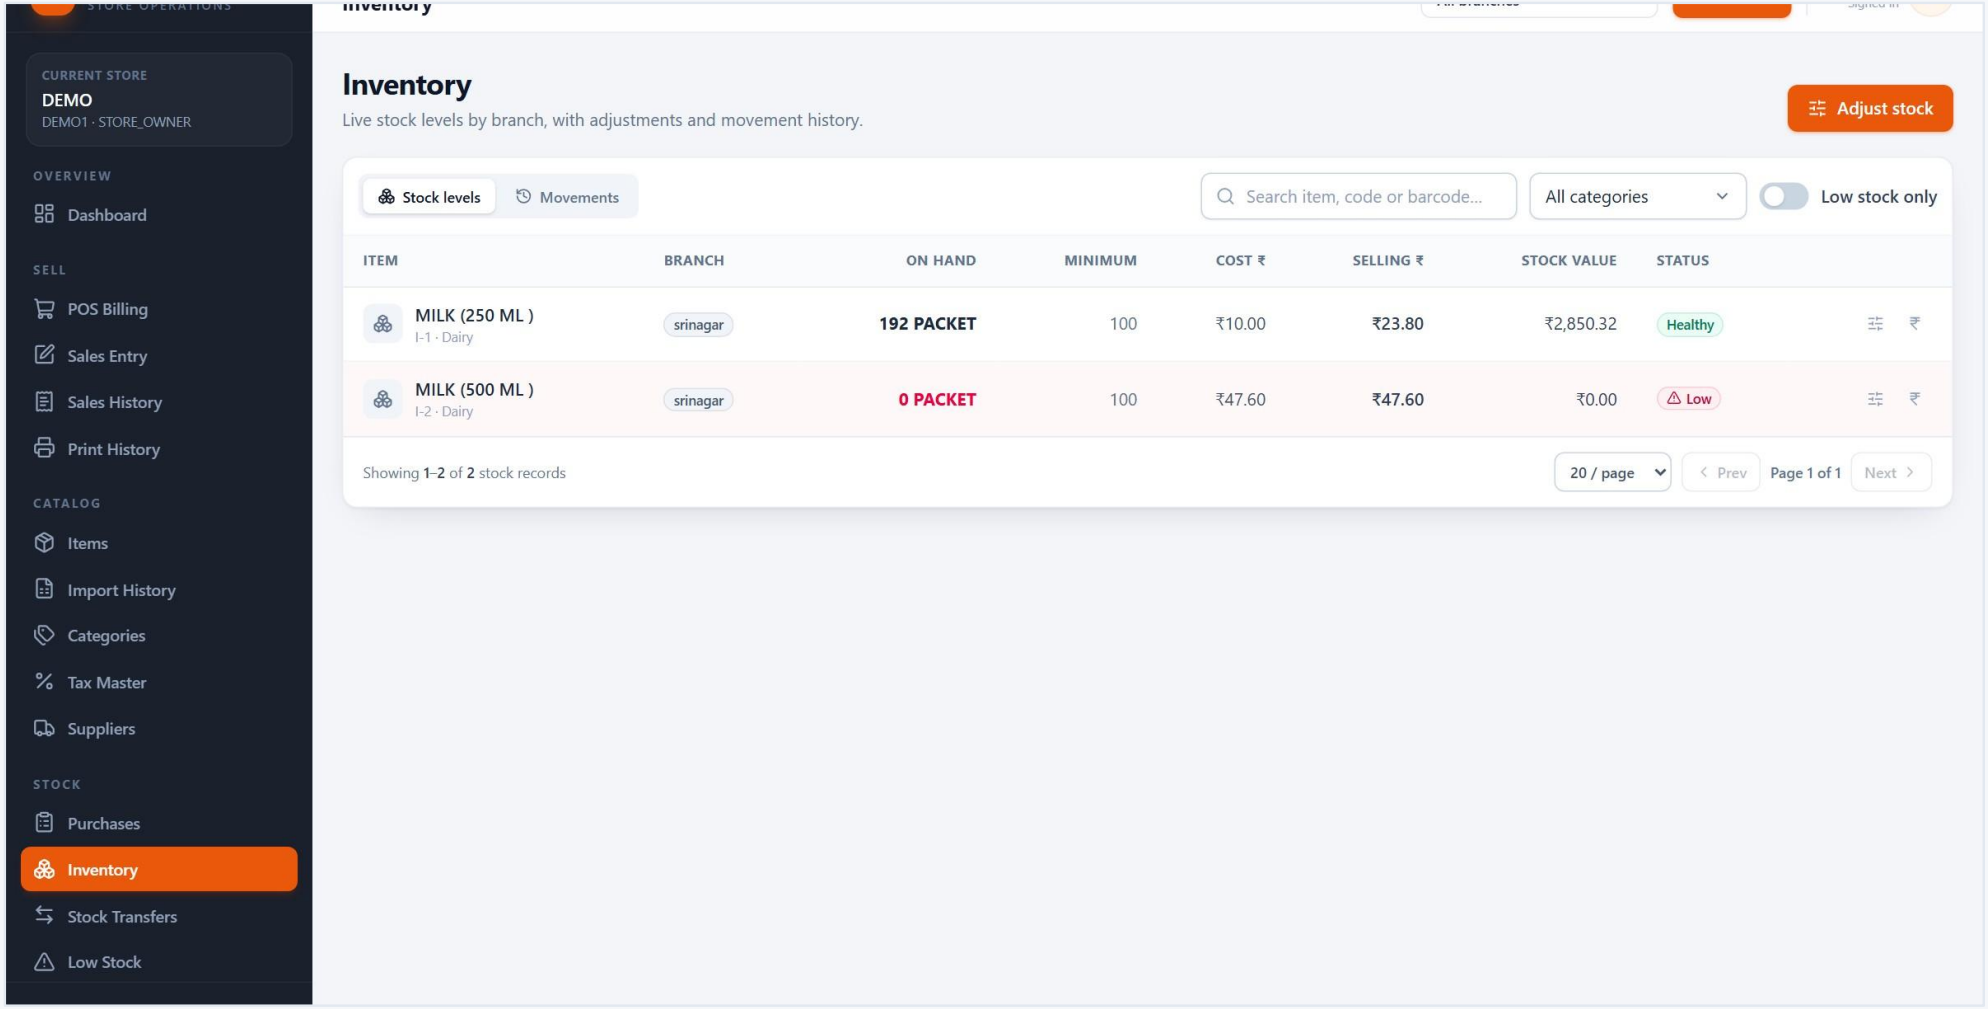

Stock is the number everyone argues about. IMS keeps one ledger per branch and shows every movement behind the number.

1. Stock on hand, minimum and low-stock status
2. Adjustments with a reason and a record
3. Movement history across purchases and sales
4. Transfers between branches, with approvals

INVENTORY

Stock on hand, branch by branch

The number is calculated from purchases, sales, adjustments and transfers — not maintained by hand.

- **On hand**
- **Minimum**
- **Status**
- **Actions**

Adjustments explain the difference

Damaged, expired, counted differently or received without a bill — record the reason, not just the number.

1. **Stock in or out**

   Choose the direction and the quantity; IMS adds or removes it at this branch.

2. **Reason required**

   A short reason turns an unexplained change into an auditable movement.

3. **Immediate effect**

   The on-hand figure and stock value update as soon as the adjustment is saved.

4. **Visible in history**

   Every adjustment appears in the movement ledger with its reference.

INVENTORY

Every change leaves a movement

Purchases, sales, adjustments and transfers in one chronological ledger.

- **Movement ledger**
- **Reference**
- **Quantity**
- **Balance**

INVENTORY

Transfers move stock with approval, not by editing two branches

A four-stage flow keeps the sending and receiving branches honest.

1 Pending

A branch requests stock from another branch; quantities are recorded but not moved.

2 Approved

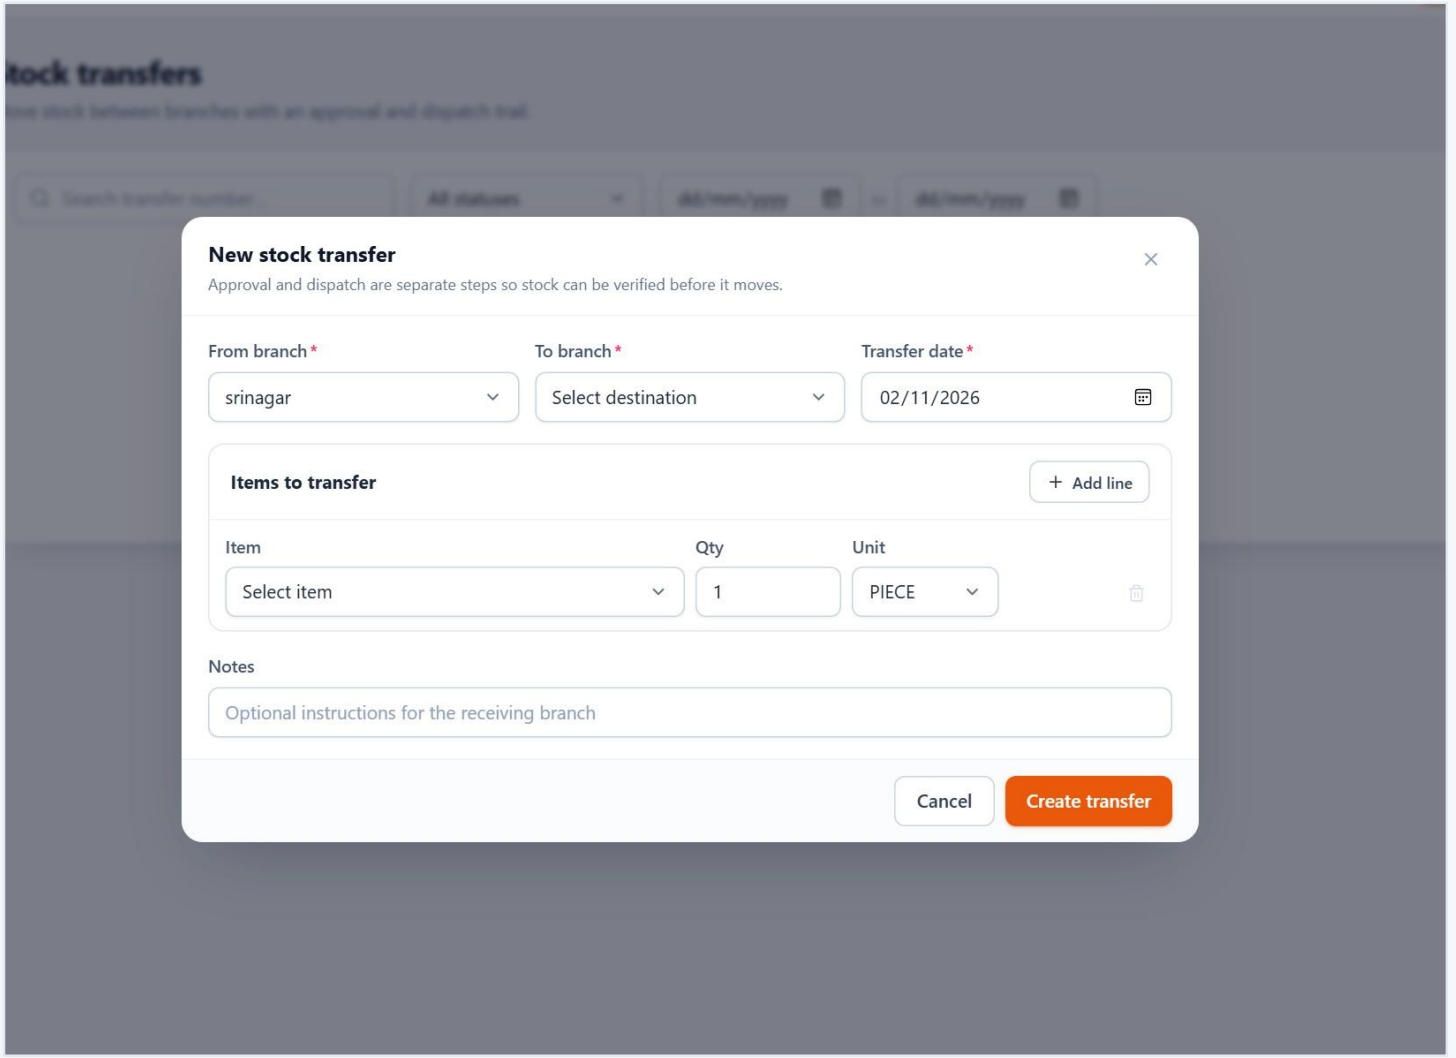

A user with approval permission accepts the request. Stock is still untouched.

3 Dispatched

Stock leaves the source branch — this step cannot be undone.

4 Received

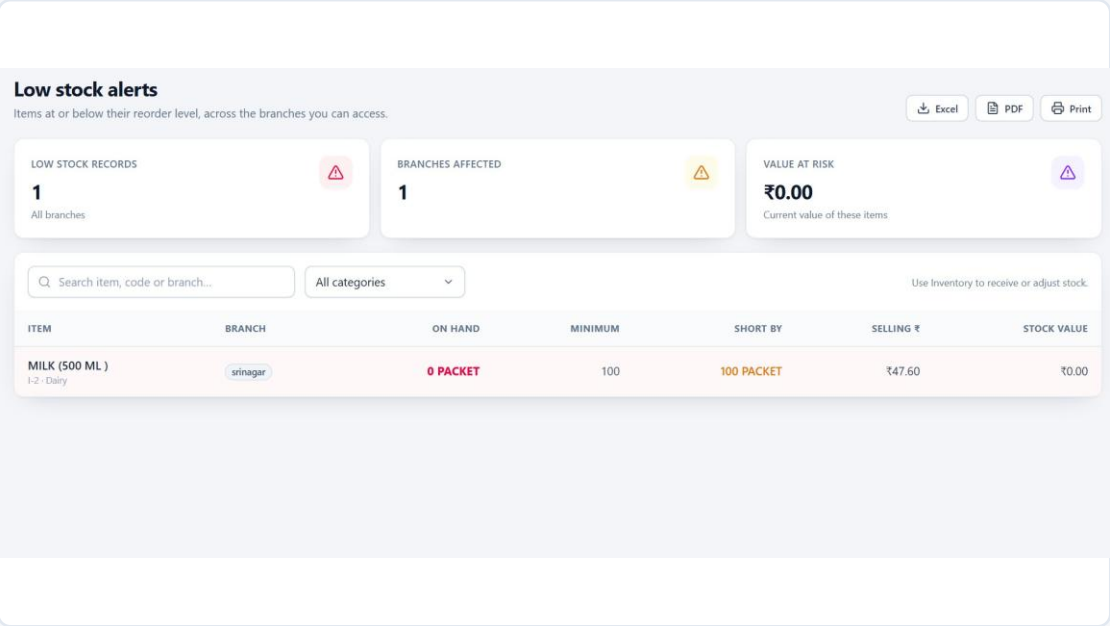

The destination confirms arrival and the stock becomes available there.

INVENTORY

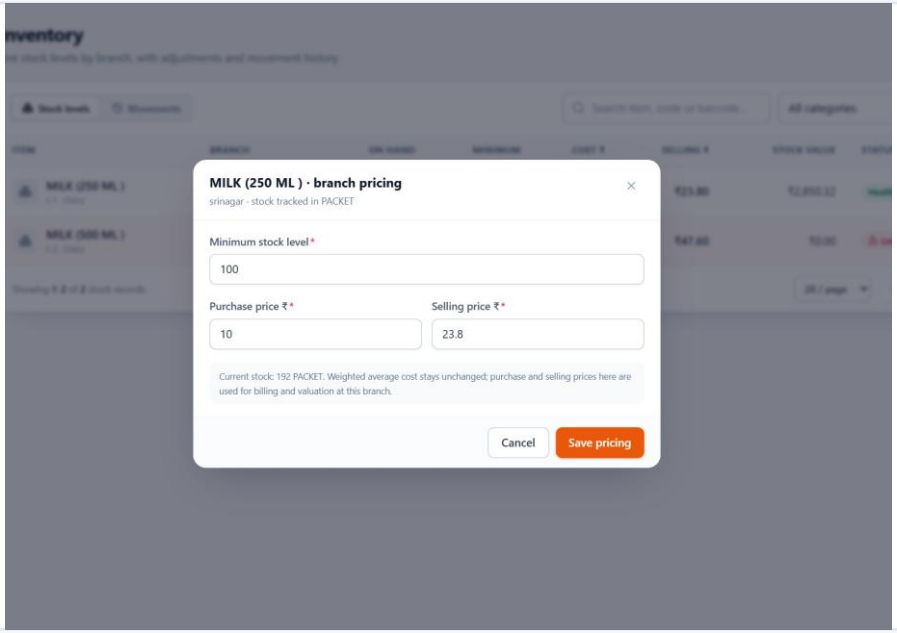

Low stock and branch pricing — two views of the same shelf

Reorder before the shelf empties; price per branch without duplicating the item.

Low stock

One list of items at or below their minimum, with the branch and quantity. The dashboard alert links here.

Branch pricing

Minimum, purchase and selling price per branch. The master rate stays the POS default.

08

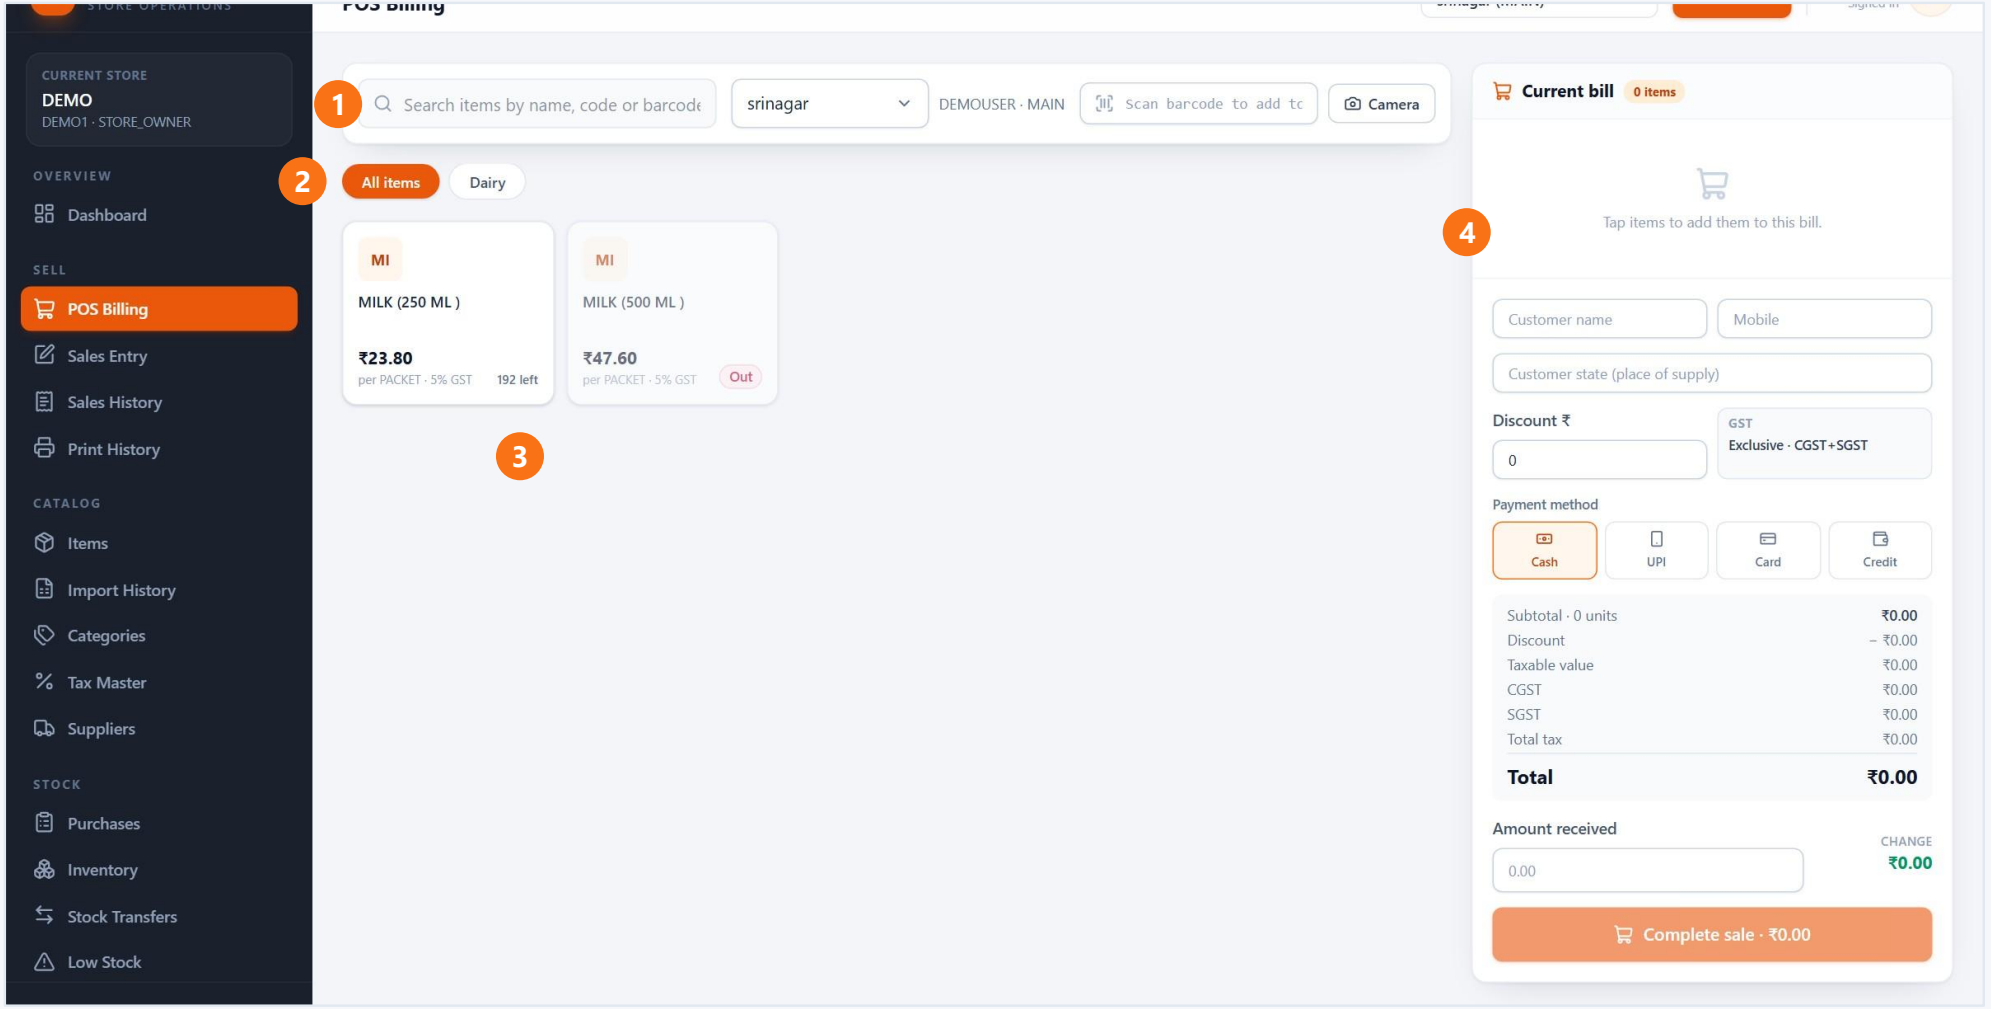

POS and sales

The counter is where the system earns its keep: scan, confirm quantity, take payment, print, move on.

1. POS billing with item cards and scan
2. Quantities, discounts, tax and four payment labels
3. Completing a sale and finding it later
4. What cancellation does to stock

POS is built for speed at the counter

Search or scan, tap an item, adjust quantity, take payment — all on one screen.

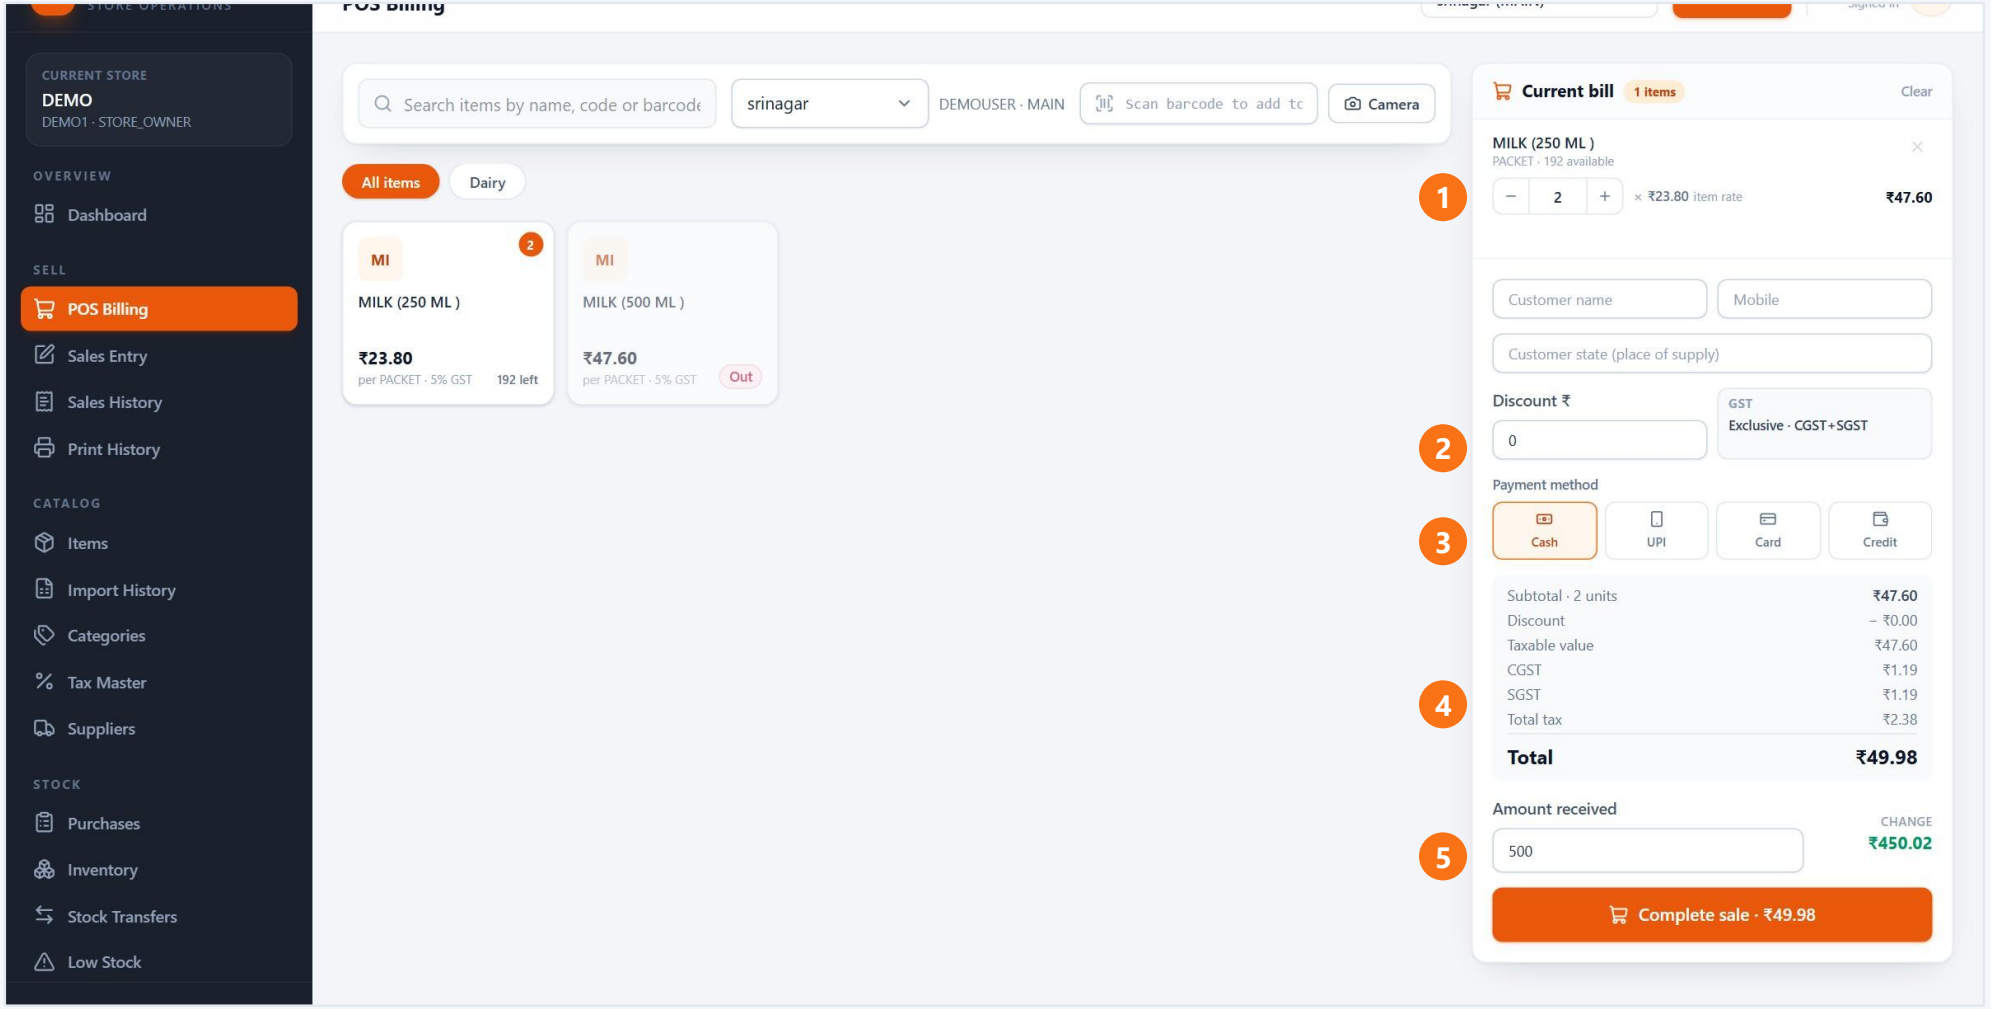

1 **Search or scan** 2 **Categories** 3 **Item cards** 4 **Current bill**

POS

The cart shows every number before the customer pays

Quantity, discount, tax, payment method, amount received and change — in one column.

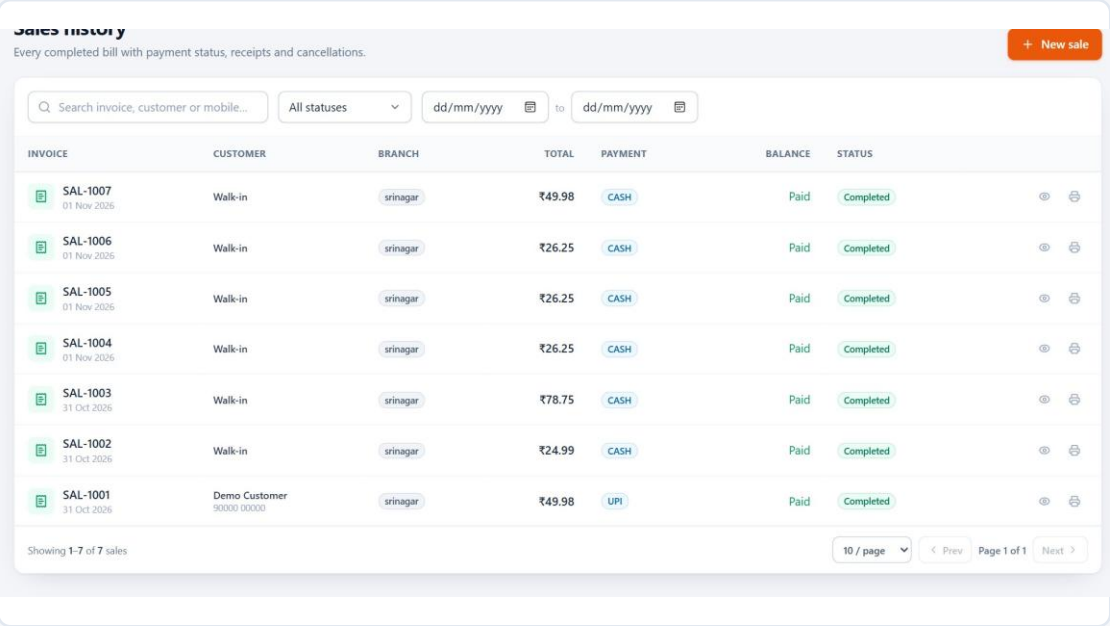

1 **Quantity** 2 **Discount** 3 **Payment** 4 **Totals** 5 **Change**

SALES

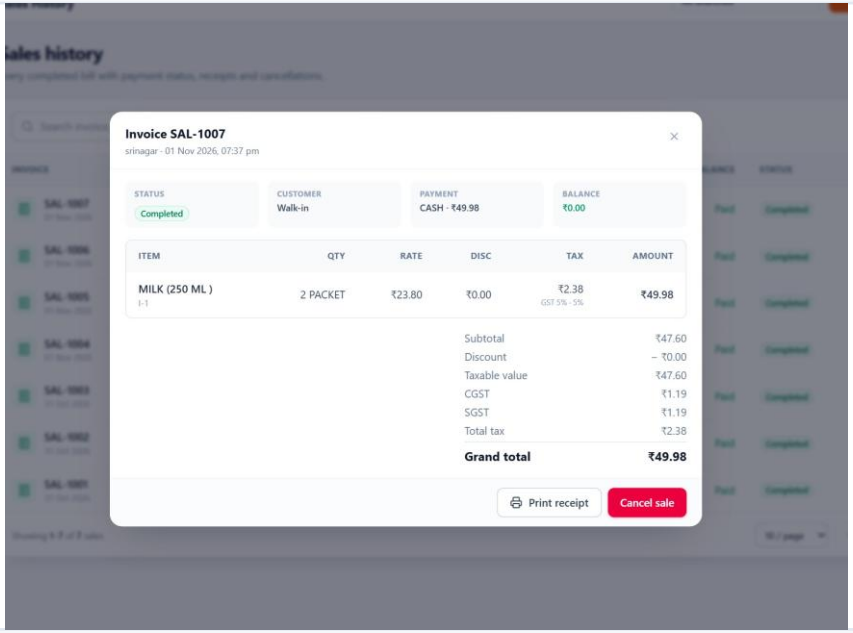

Every bill can be found, reopened and reprinted

Sales history keeps the header; the invoice keeps the lines, tax and payment.

Sales history

Bill number, date, customer, payment, total and status. Seven demo bills, all completed.

Invoice detail

Line items, tax split and payment — the same data used for the receipt and the GST report.

SALES

What completing a sale actually does

Four writes happen together; the customer sees only the receipt.

01

Stock moves

The quantity sold is deducted from the selected branch immediately. The cart cannot sell more than the branch holds.

02

A bill is numbered

IMS assigns a SAL- invoice number and stores the branch, cashier, customer and payment method for later lookup.

03

Tax is snapshotted

Rate and tax are stored on each line, so later price or slab changes cannot rewrite old bills or reports.

04

Cancel restores

Cancelling a completed sale returns the stock and keeps the record marked cancelled — it does not delete history.

Limits in v1.0.0: no returns or credit notes, no receivables tracking, no accounting ledger.

09

Printing

A receipt that appears without extra clicks, a label that sticks, a report on paper when the accountant asks.

1. Thermal receipts through a local bridge
2. Barcode labels and reports through the browser
3. Print history, reprints and failures
4. What must be configured before the first print

PRINTING

From bill to paper, in six steps

The same flow for an automatic receipt and a manual reprint.

1 Choose print option

Complete a sale with auto-print on, or press Print on a saved bill.

2 Use a configured printer

The store's device, paper width and purpose are already stored.

3 Generate content

IMS builds the receipt from the saved bill — not from the screen.

4 Send the job

The browser sends it to the local bridge on the counter machine or phone.

5 Printer processes

The bridge forwards the job to the printer's IP and port.

6 Printed output

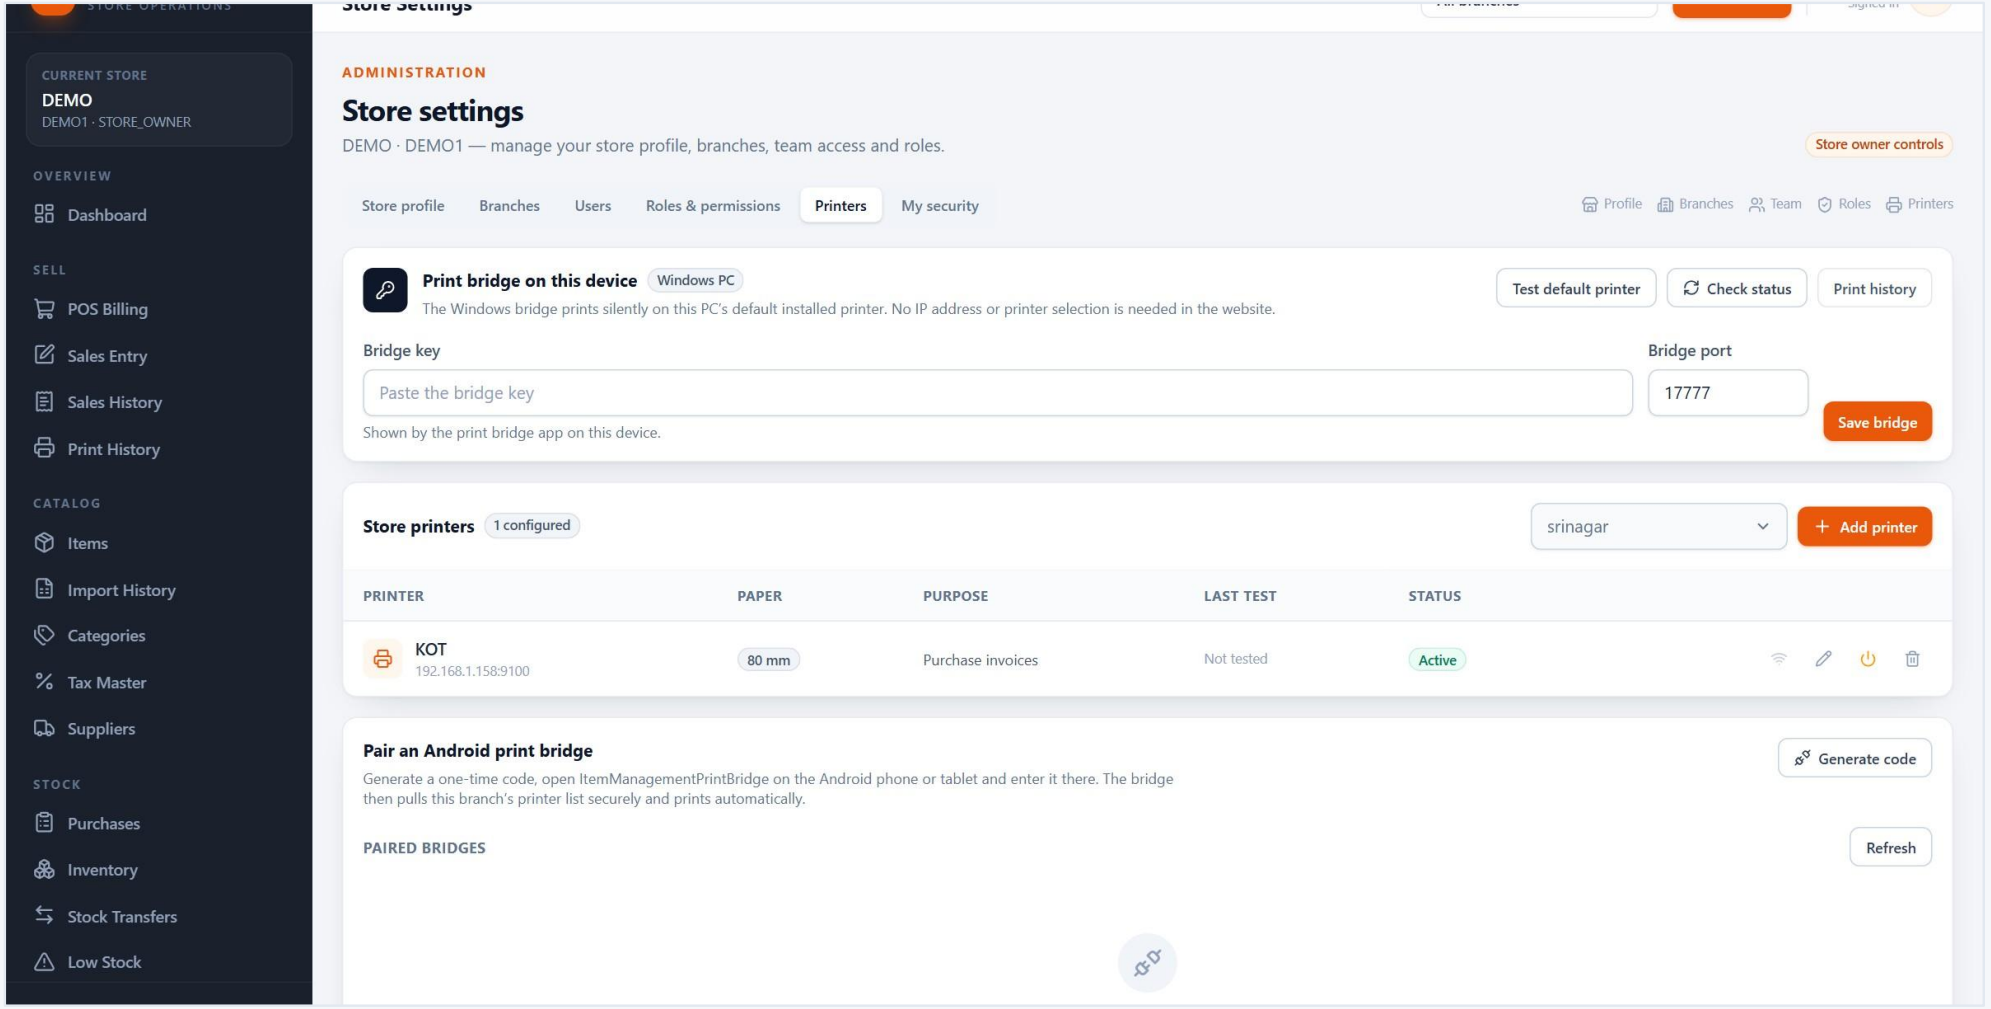

The job is marked printed; failures stay visible for a reprint.

The receipt content comes from the saved bill, so a reprint months later shows the same lines and totals.

PRINTING

Printers are configured once, per store

Name, network address, paper width, purpose and the bridge that will deliver the job.

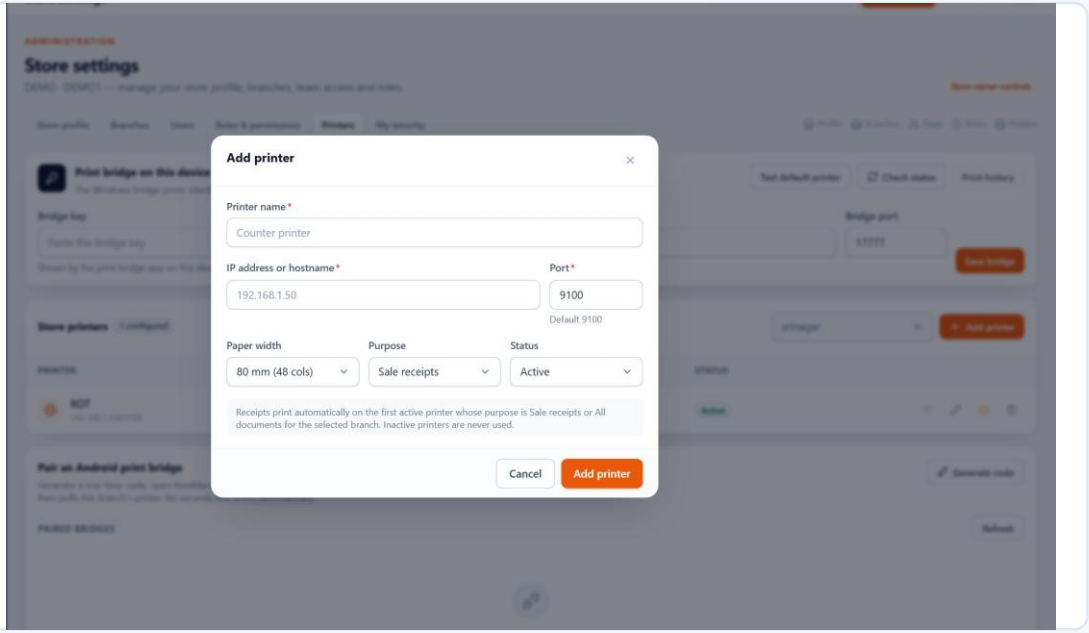

- **Windows bridge, counter PC**
- **Network printer per branch**
- **80 mm thermal paper**
- **Not physically tested**

PRINTING

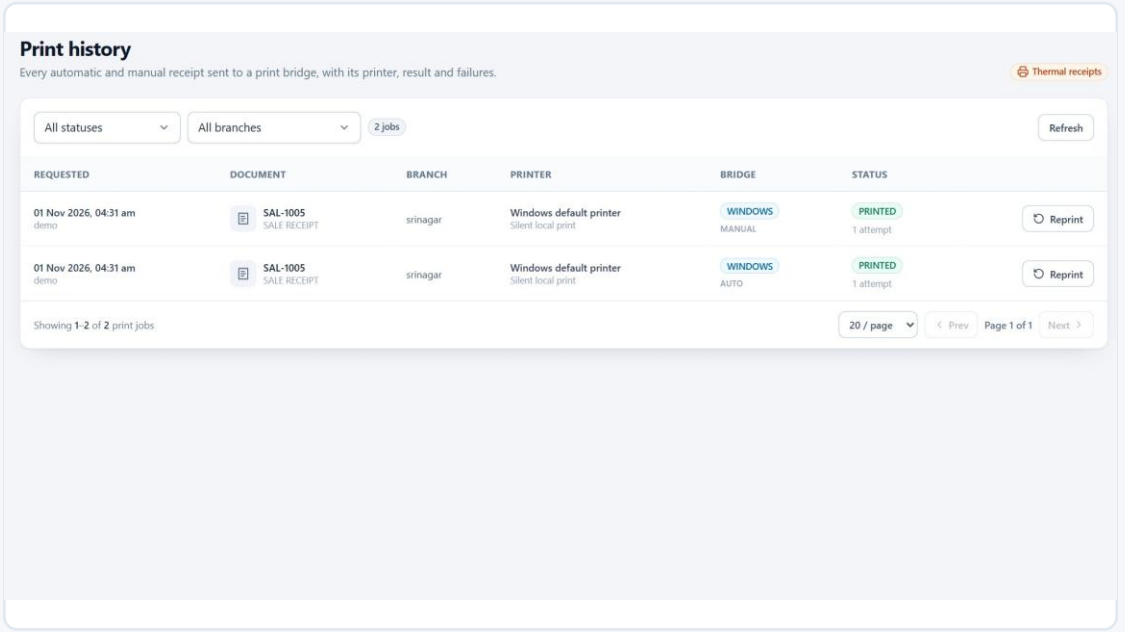

Adding a printer, and watching the queue

Configuration takes one form; the history tells you what actually happened.

Add printer

Name, connection type, IP and port (9100 for a network thermal printer), paper width and purpose.

Print history

Automatic and manual jobs with status. A reprint creates a new manual job instead of hiding the failure.

PRINTING

Three print paths, one consistent result

Different documents leave the system in different ways — and that is intentional.

RECEIPTS

Through the bridge

Sale receipts are sent as jobs to the local bridge (Windows on port 17777, Android on 17778), then to the thermal printer. The bridge pairs with a code valid for ten minutes.

LABELS

Through the browser

Barcode labels are generated as a 50 × 30 mm PNG and printed from the browser's print dialog. No bridge or drivers are involved.

REPORTS

Through the browser

Sales, purchase, stock and GST reports export to Excel or PDF, or print directly from the browser. Exports are generated on the client, not on the server.

Before the first receipt: install the bridge, add the printer, pair the device, then send a test receipt.

PRINTING

When a receipt does not appear, check these five things

Most failures are network or pairing problems, not software faults.

1. **Bridge running**
   The Windows service or Android app is open and shows as paired.

2. **Same network**
   The counter machine and the printer are on the same local network.

3. **Printer address**
   IP and port 9100 are correct; the printer answers on that address.

4. **Paper width**
   58 mm or 80 mm matches the physical roll, or the layout will clip.

5. **Pairing code**
   The ten-minute code has not expired; re-pair if it has.

WHAT WE CAN HONESTLY SAY

- The job pipeline, bridge pairing, statuses and reprint flow were exercised in testing.
- No physical printer was connected in the demo store, so paper output is not claimed as tested here.
- There is no automatic retry: a failed job stays failed until someone reprints it.
- Receipts are thermal sale receipts; A4 invoice printing is done from the browser.
- The Android application is a print bridge, not a mobile version of the store app.

10

Reports and GST

Reports should answer a question, not just display a table.

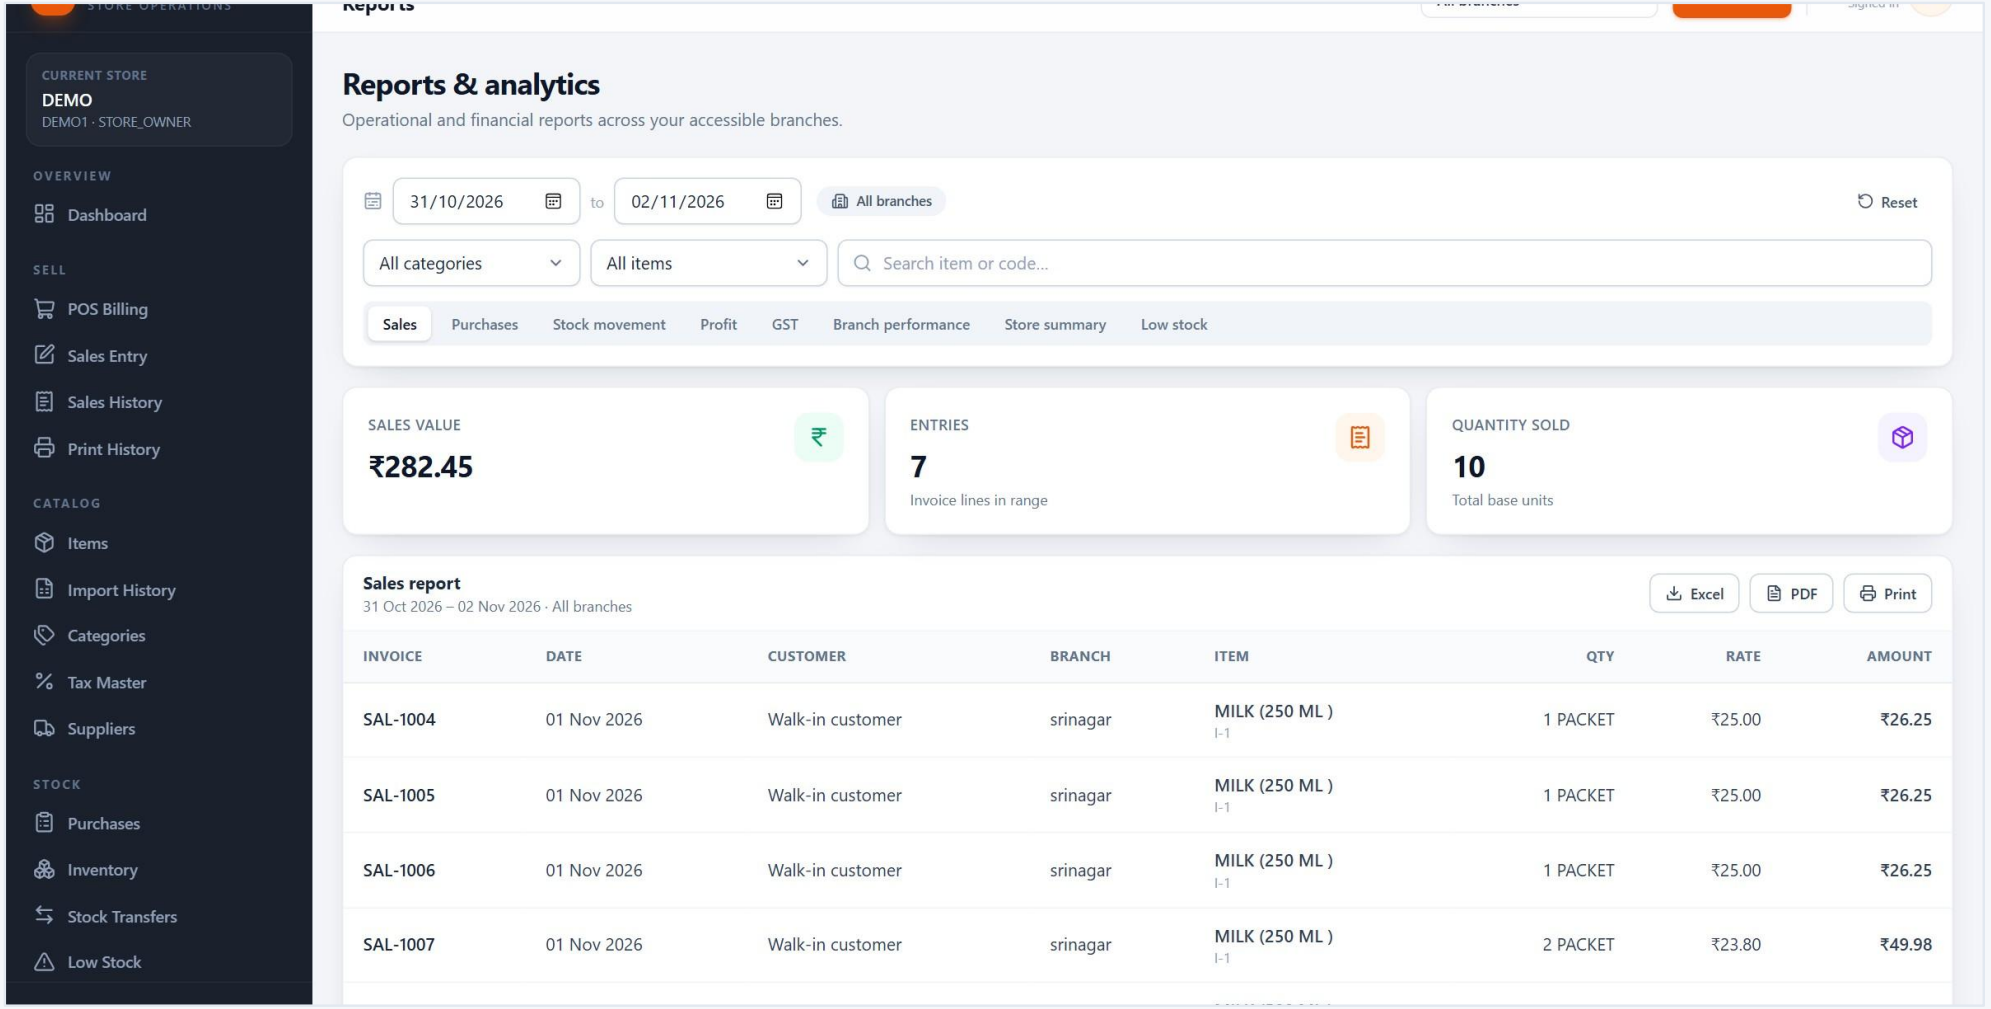

IMS ships eight views with the same filters.

1. Sales, purchases, profit, stock movement
2. GST summary with CGST, SGST and IGST
3. Branch performance, store summary, low stock
4. Date range, branch, category and item filters

REPORTS

Eight reports, one set of filters

Choose a date range, a branch and optional category or item — every tab uses the same context.

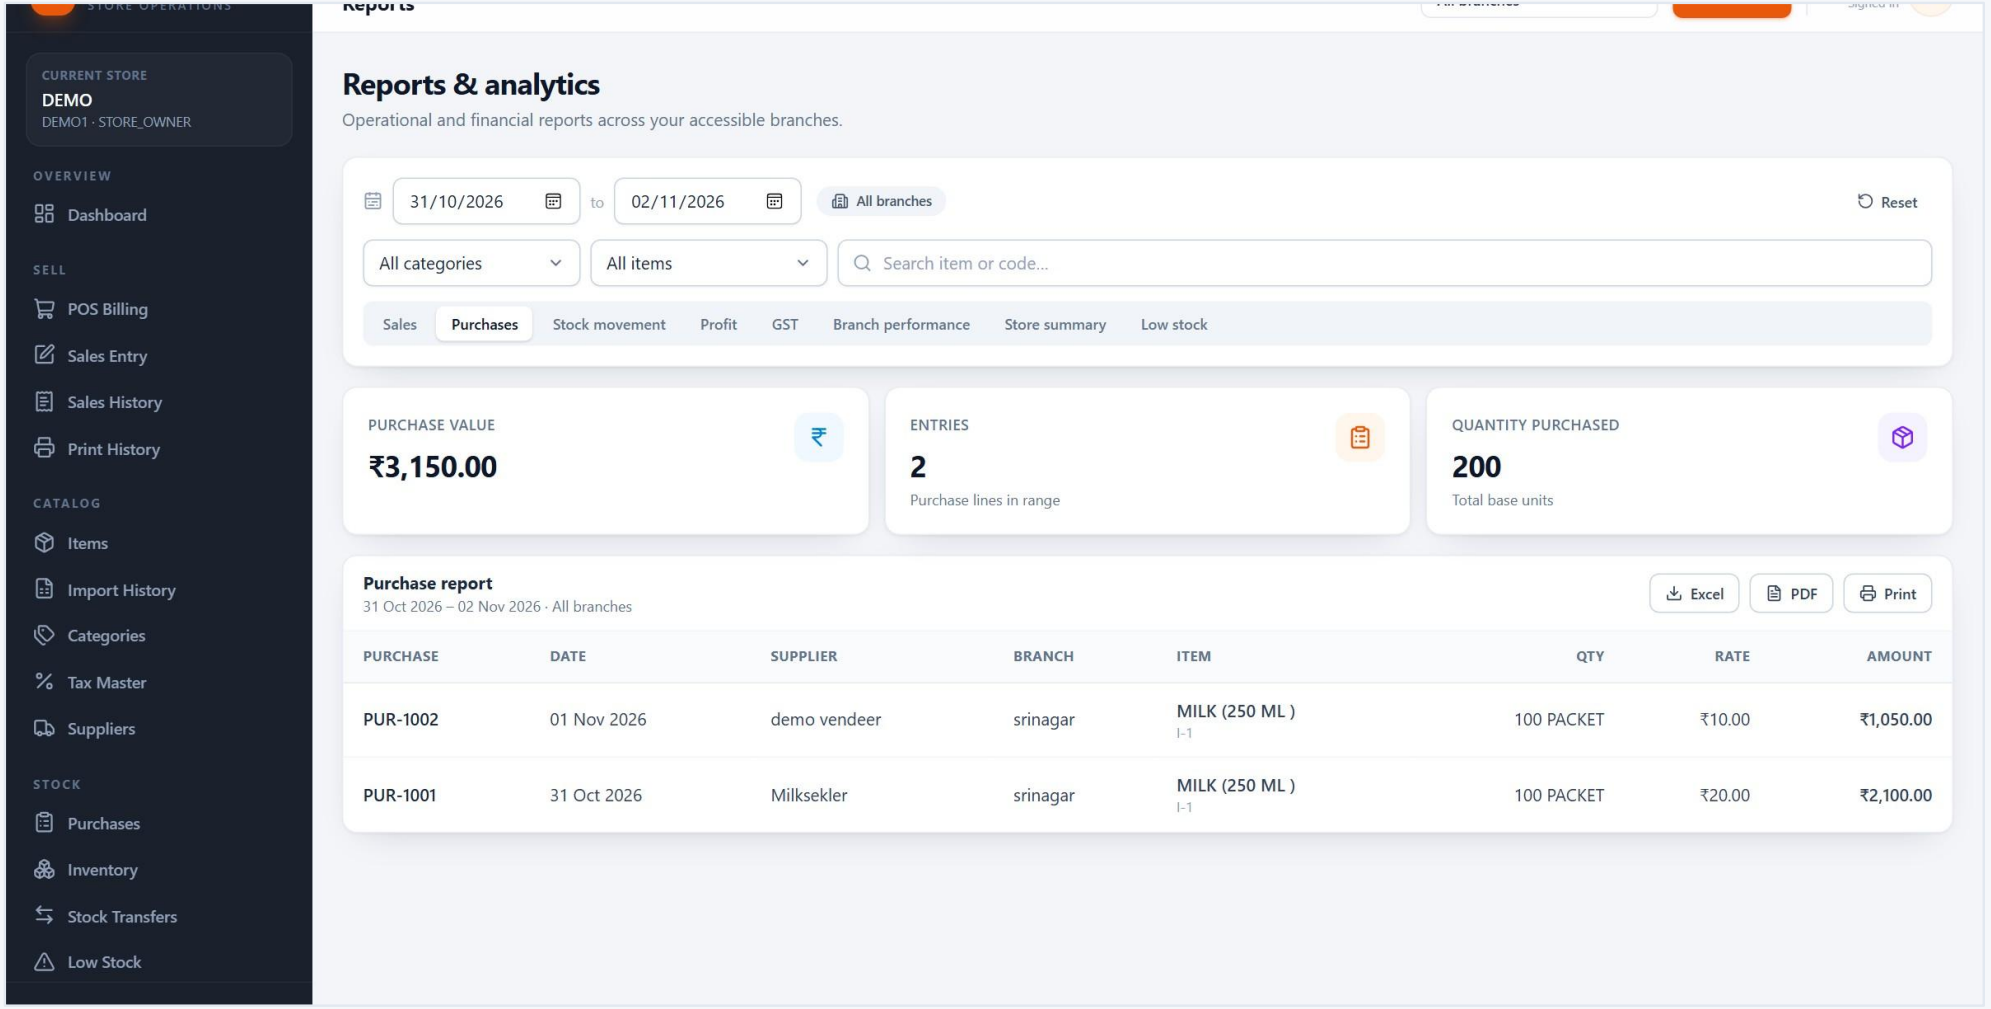

- **Date range**
- **Branch**
- **Report tabs**
- **Export**

REPORTS

A purchase report the accountant can use

Value, line count, quantity and the underlying bills — exportable to Excel or PDF.

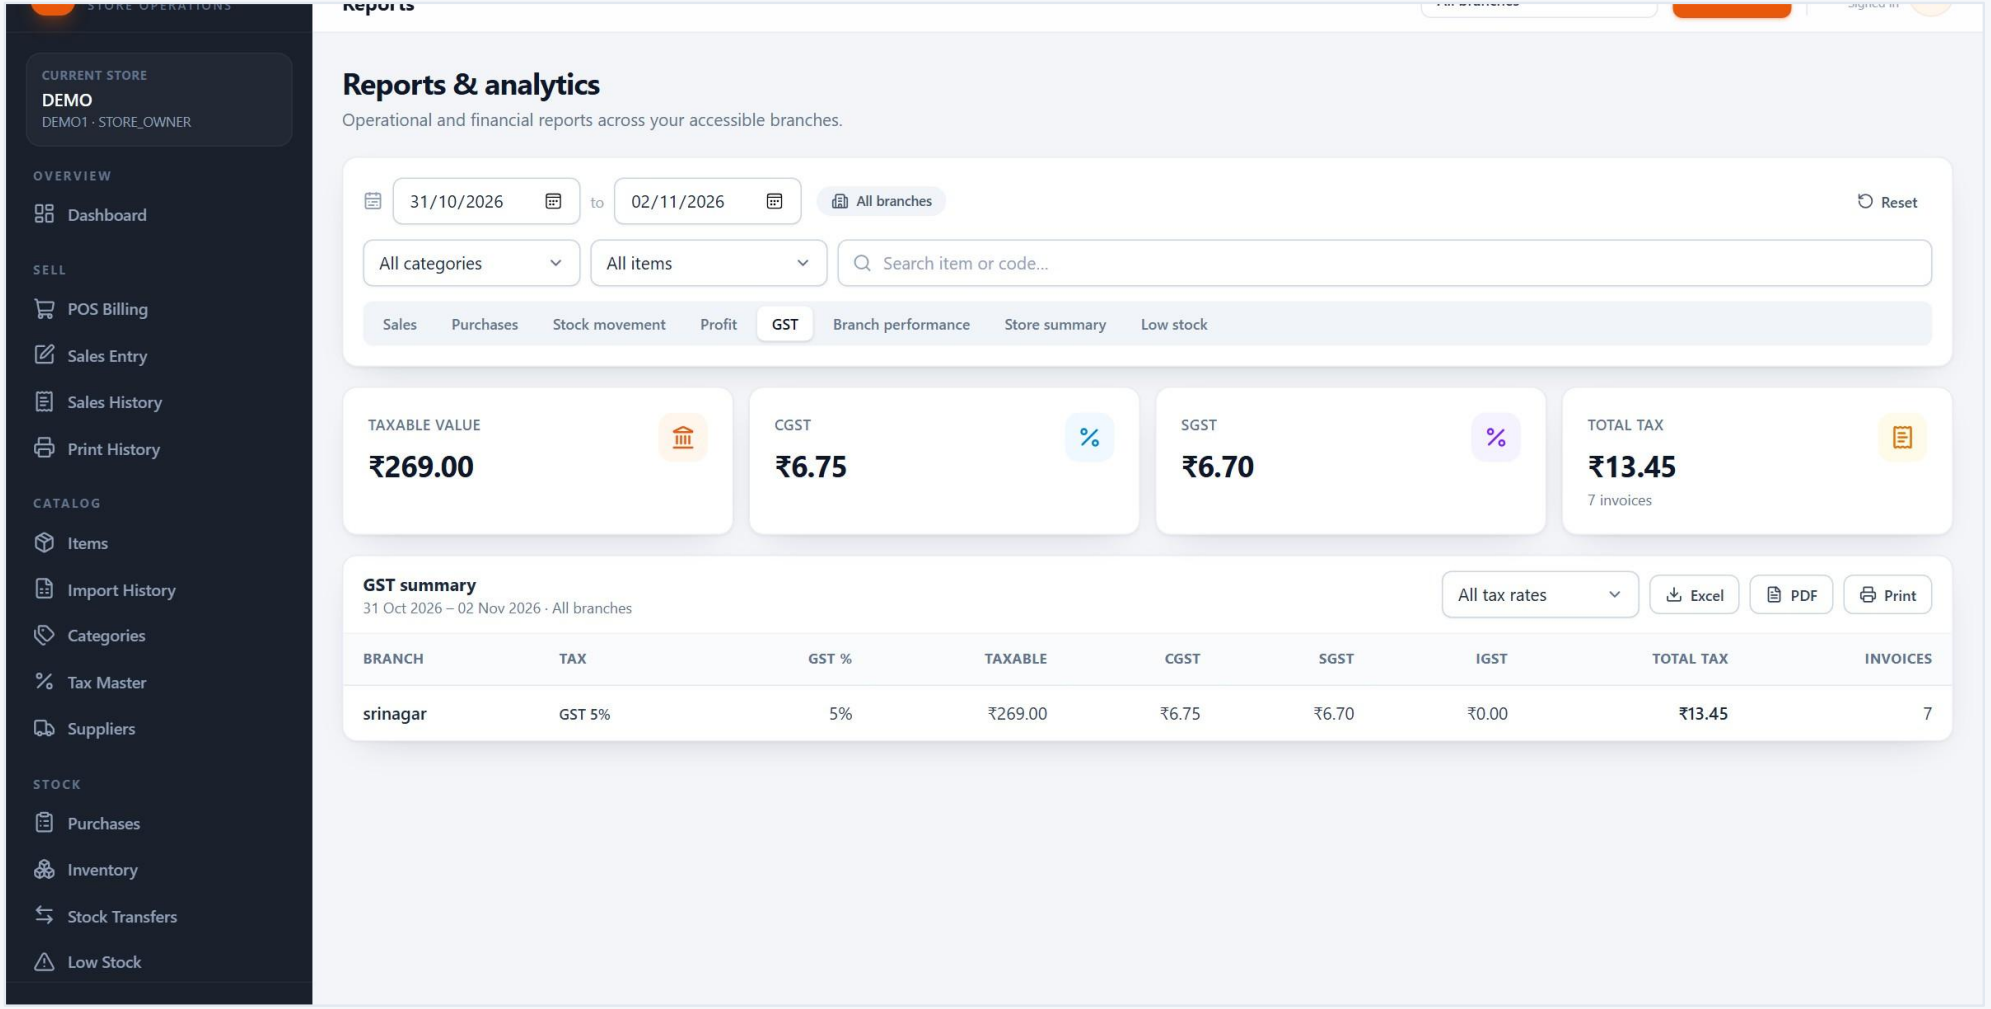

- **Purchase value**
- **Entry count**
- **Quantity**
- **Export**

REPORTS

GST, calculated from the same lines that made the bill

Taxable value, CGST, SGST and invoice count for the selected period and branch.

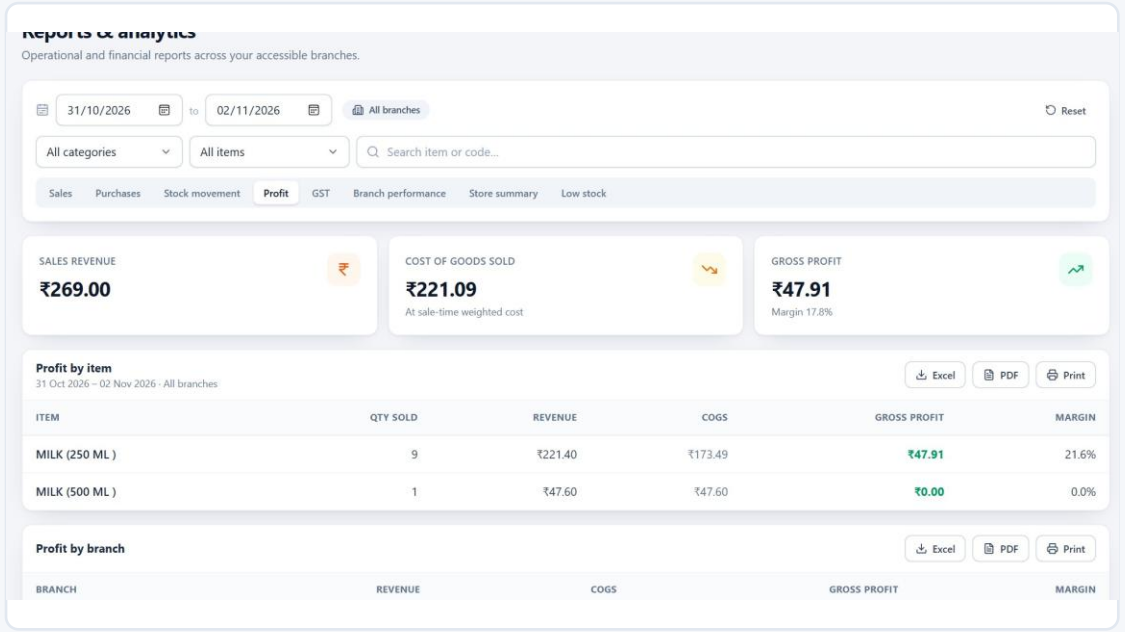

- **Taxable value**
- **CGST / SGST**
- **Total tax**
- **Invoice count**

REPORTS

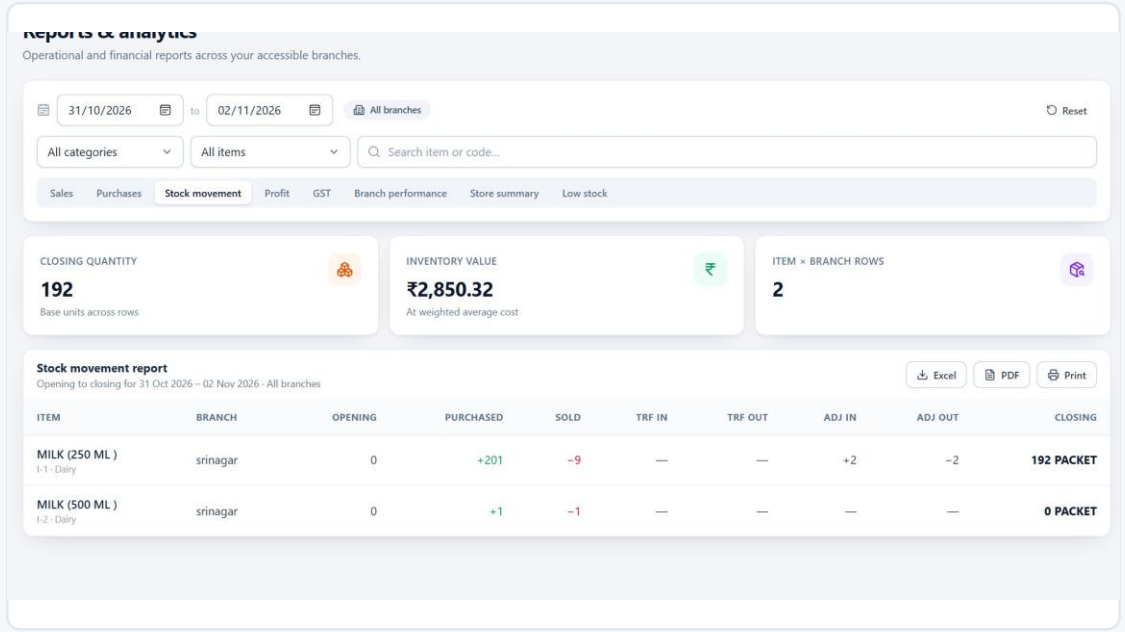

Profit and stock movement — the two questions owners ask most

What did we earn, and where did the stock go?

Profit

Revenue, cost of goods sold and gross margin for the period. Demo: 269 rupees revenue, 221.09 cost, 47.91 gross.

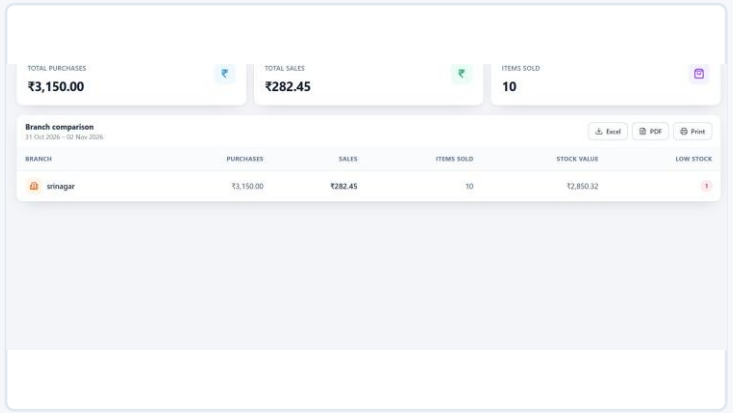

Stock movement

Opening, in, out and closing quantities with value. Demo: 192 units closing, 2,850.32 rupees value.

REPORTS

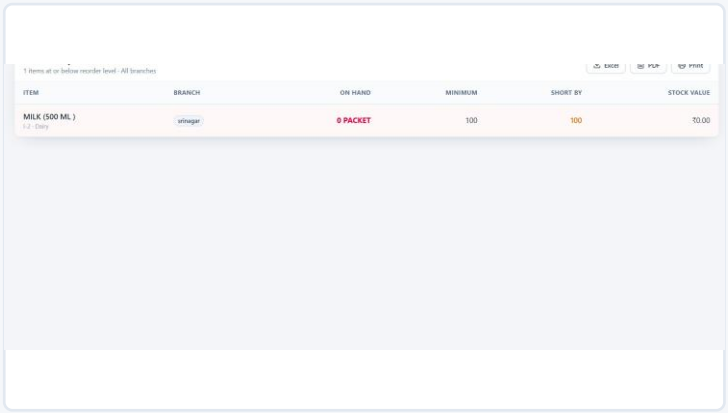

Branch performance, low stock and the store summary

Three views for the weekly review: compare locations, act on shortages, see the whole store.

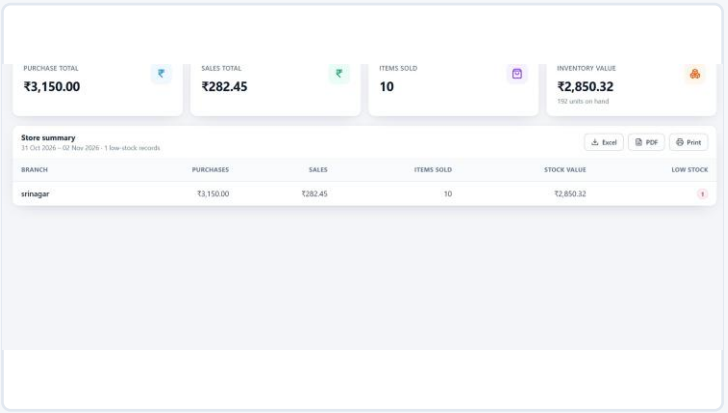

Branch performance

Sales and purchases per branch. The demo branch shows 282.45 in sales against 3,150 in purchases.

Low stock

Items at or below minimum with quantity and branch — the buying list for tomorrow.

Store summary

One roll-up of sales, purchases, tax and stock value for the whole store.

REPORTS

GST in plain English

Four rules explain every number in the report.

01

Exclusive or inclusive

The store setting decides whether an item rate already contains GST. Switching it changes how rates are entered, not the tax logic.

02

Intra or inter-state

A customer state equal to the store state splits tax into CGST and SGST. A different state produces IGST.

03

Line-level snapshots

Tax is calculated and stored per line, so mixed slabs on one bill and later edits cannot corrupt history.

04

One report, one period

The GST report covers sales for the chosen dates and branches — the figures an accountant needs to reconcile.

REPORTS, NOT FILING

IMS calculates and reports GST; it does not file returns, issue e-invoices or e-way bills, or maintain HSN codes. Missing customer state is treated as intra-state.

11

Platform administration

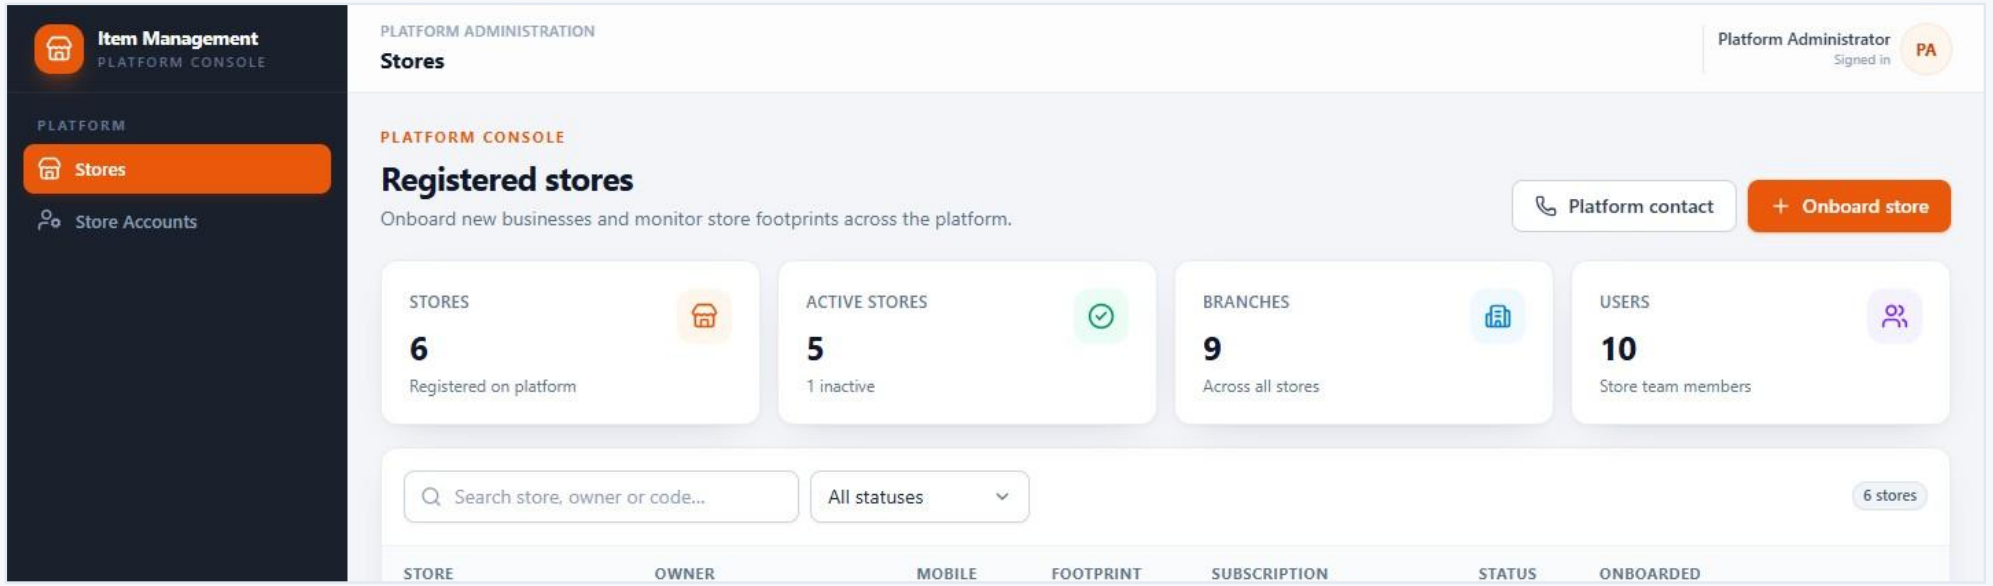

The service behind the stores: onboarding, subscriptions, store accounts and the audit trail.

1. Store list, status and onboarding
2. Store login accounts and credentials
3. Subscription window and branch limit
4. Who can see what — platform vs store

PLATFORM

Every store, its status and its plan

The platform administrator sees the service at a glance — aggregate counts, not store sales.

STORE LIST

Registered stores with status, subscription and branch counts.

SEARCH & FILTER

Find a store by name or code before changing anything.

ONBOARD

Create a store, set its plan and its first owner account.

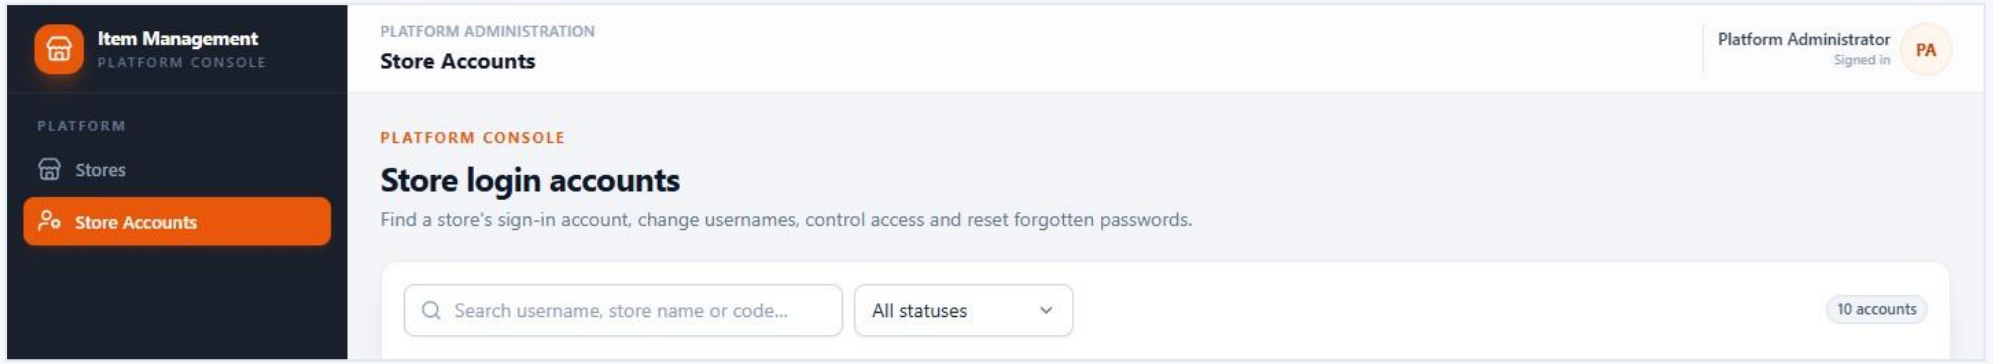

AGGREGATE VIEW

The demo platform shows six stores, five active, nine branches and ten store users. Those are counts, not a way into any store's records.

PLATFORM

Store login accounts, managed without shared passwords

Reset a password, change a username, disable an account — every action leaves a trace.

ACCOUNT LIST

One row per store login, with its store and current state.

RESET

A temporary password is issued and must be changed at next sign-in.

CHANGE OR DISABLE

Username changes and resets invalidate the person's existing sessions.

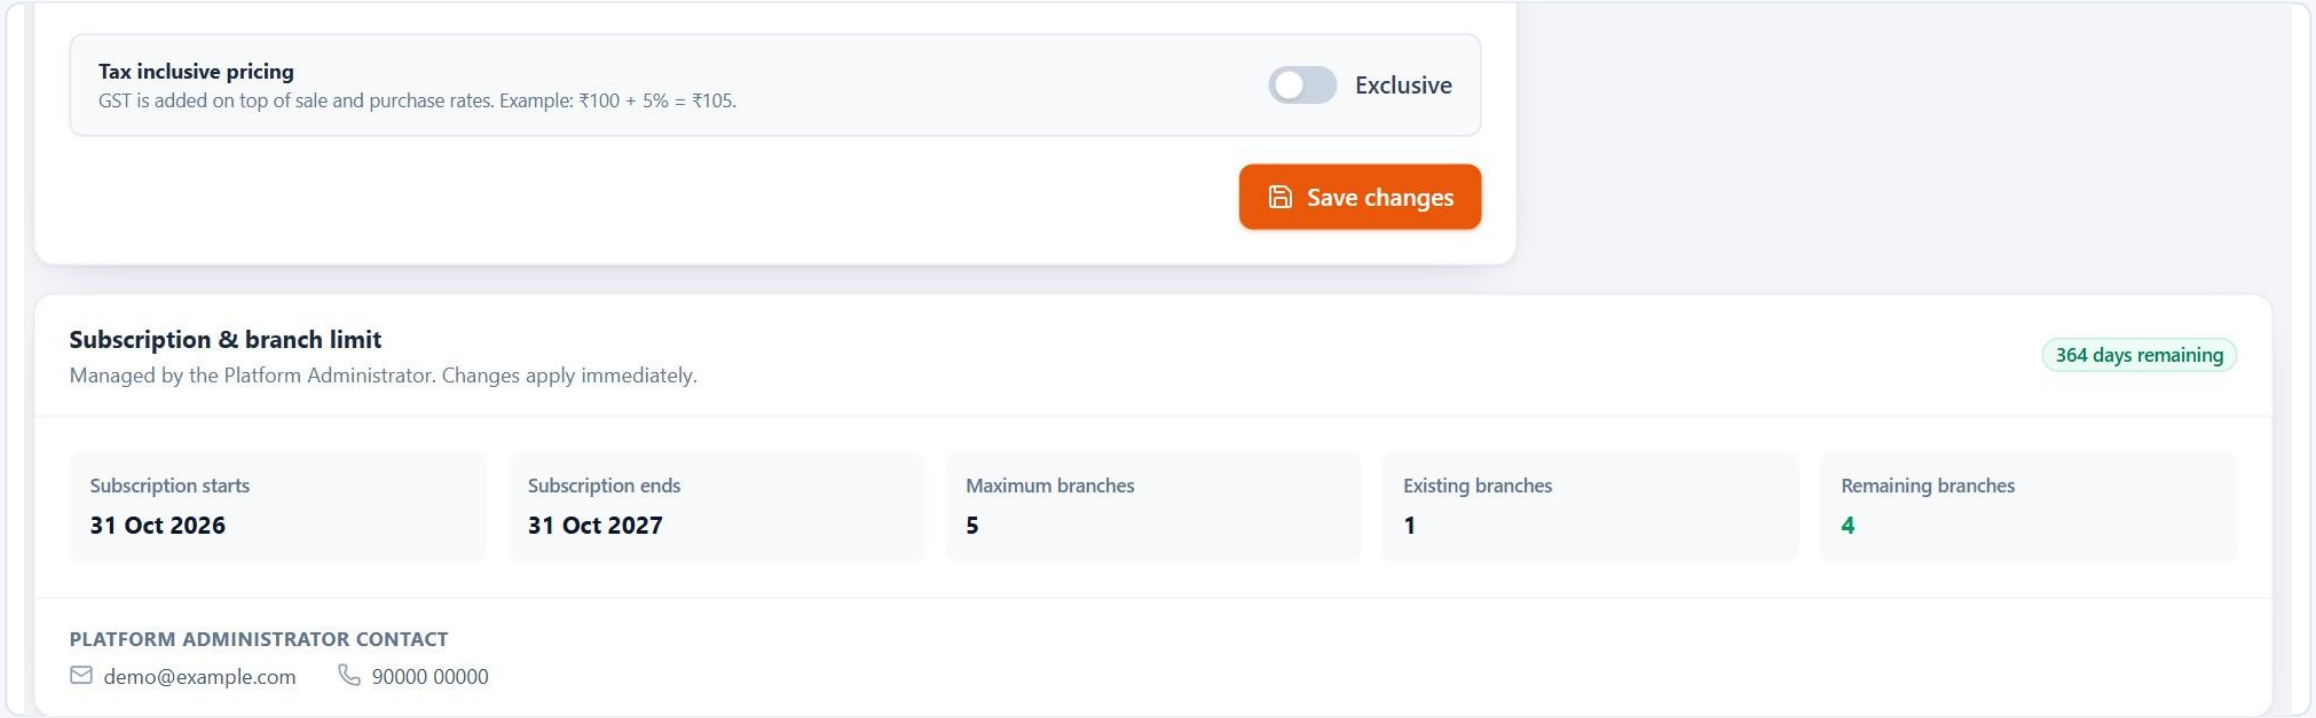

WHY IT MATTERS

There is no shared owner password and no self-service reset in v1.0.0. The platform team issues a temporary credential, the store user changes it immediately, and old sessions stop working.

PLATFORM

The subscription controls time and branch count

Both are enforced by the server, not by the honour system.

1. **Active window**
   A start and end date; the demo store has 364 days remaining on a one-year term.

2. **Branch allowance**
   The plan allows up to five branches and the store currently uses one.

3. **Expiry behaviour**
   When the window ends, business actions are blocked until the platform renews it.

4. **Renewal**
   Renewal is handled by the platform administrator; there is no self-serve checkout.

Expired or over-limit stores are refused by the server; renewal is a platform action, not a card payment in the app.

12

The complete business workflow

One loop connects setup, buying, stock, selling, printing and reporting — every day.

1. Setup once, operate daily
2. The same item and stock ledger across modules
3. A realistic day with demo numbers
4. Where owners and staff touch the loop

WORKFLOW

One loop, every working day

Each step feeds the next, and the last step feeds tomorrow.

1. **Set up**
   Store, branches, users, taxes.
2. **Add items**
   Catalogue, rates, labels.
3. **Buy stock**
   Supplier, quantities, cost.
4. **Receive**
   Stock and average cost update.
5. **Sell**
   Scan, bill, payment, receipt.
6. **Print**
   Receipt, label or report.
7. **Review**
   Sales, profit, GST, stock.
8. **Adjust**
   Low stock, transfer, reorder.

The loop closes: what you sell changes stock, what stock needs changes tomorrow's purchase, and what you purchase changes the cost used in tomorrow's profit report.

WORKFLOW

A day in a store using IMS

Illustrative times, with the demo store's real numbers where they exist.

1

08:30

Open and bill

Cashier signs in, selects the branch, scans the first customer's items. Stock and tax are checked as the cart is built.

2

10:15

Delivery arrives

Owner completes the purchase: supplier, 100 packets at 10 rupees, 5% tax. Stock and average cost update.

3

12:30

Lunch rush

Two 250 ml packs at 23.80 sell for 49.98 including 2.38 tax. Receipt printed or browser-printed.

4

18:00

Shelf check

Low-stock list shows the 500 ml pack at zero. A transfer request or purchase is raised for tomorrow.

5

20:30

Close and review

Owner checks sales, profit, stock value and today's GST total; the next purchase list is ready.

The example uses the demo store's rates; a real day would also include adjustments, cancellations and a branch transfer.

13

Benefits and next steps

What changes for the business, what this version deliberately does not do, and how to start.

1. Eight practical benefits
2. The honest scope of v1.0.0
3. A simple path to the first live day

BENEFITS

Eight things that change on day one

Most of the value comes from removing duplicate work, not from adding screens.

01

One catalogue

Every bill, purchase and report uses the same item master.

02

Visible stock

On-hand quantity per branch, updated by the work itself.

03

Barcode speed

Scan instead of typing; no code memorisation at the counter.

04

Purchase control

Supplier bills update stock and average cost automatically.

05

Branch clarity

Compare locations and price locally without duplicating items.

06

Role-based access

People see the modules and branches their role allows.

07

Organised records

Bills, movements and imports remain searchable and auditable.

08

Printing & reports

Receipts, labels and eight reports from one system.

SCOPE

What v1.0.0 does — and does not — do

Stated plainly, so there are no surprises after go-live.

NOT IN THIS VERSION

- Offline billing or a mobile store app
- MFA, SSO or self-service password reset
- Returns, credit notes and receivables
- Accounting ledger or bank reconciliation
- GST filing, e-invoicing, e-way bills, HSN
- Automatic retry of failed print jobs
- Deleting stores, items, users or branches

WORKS WITH LIMITS

- Report exports run in the browser, not on the server.
- Very large Excel imports may hit the web host's upload limit.
- Some malformed API calls return a generic server error.
- A physical thermal printer was not tested in this demo environment.
- The Android app is a print bridge only.

BY DESIGN

- Platform staff cannot browse store sales, stock or items.
- Stores and accounts are disabled, not deleted.
- Subscription renewal is handled by the platform team.
- Tax is snapshotted on every line for auditability.
- Stock is branch-level; masters are store-level.

If a capability is not on this page, ask before assuming it exists. The next step is a short discovery call to map these boundaries to your process.

NEXT STEPS

Start with one store. Grow to many.

The fastest path is a guided setup with your real catalogue, one branch and one trained cashier — then add the second location when the first runs cleanly.

01 Discovery
Walk through your items, tax setup and daily process.

02 Setup
Store, branch, users, tax master and catalogue import.

03 First day
Train the counter team, print labels, run a parallel day.

WHAT YOU ARE LOOKING AT

Item Management System v1.0.0

Deployed and verified

October–November 2026

Screens in this deck: 53 captures from the live application, plus platform views and interface states. Demo data only.
